INDEX AND PLATES

TO

LECTURES

ON

NATURAL AND EXPERIMENTAL PHILOSOPHY,

CONSIDERED IN IT'S PRESENT STATE OF

IMPROVEMENT.

DESCRIBING, IN A FAMILIAR AND EASY MANNER,

THE PRINCIPAL PHENOMENA OF NATURE;

AND SHEWING,

THAT THEY ALL CO-OPERATE IN DISPLAYING

THE

GOODNESS, WISDOM, AND POWER OF GOD.

£1 x d 13

By GEORGE ADAMS,

52138

Mathematical Inſtrument Maker to His Majeſty, and Optician to His Royal Highneſs the Prince of Wales.

VOL. V.

LONDON:

PRINTED BY R. HINDMARSH,

PRINTER TO HIS ROYAL HIGHNESS THE PRINCE OF WALES,

OLD-BAILEY.

SOLD by the AUTHOR, No. 60, FLEET-STREET.

1794.

N. B. *The Roman Characters denote the Volume: thus*, i. ii. iii. iv.—*The Arabic Number the Page: thus*, 1, 2, 3, &c.

A

ACID Liquors, the variety in their freezing, ii. 63.
Agency active in nature, iii. 242.
Air, a fluid, the nature and properties of it, i. 7. Effects produced by it, *ib.* 8. It's reſiſtance, *ib.* 10. It's weight, *ib.* 12. It's preſſure in every direction, *ib.* 13, 87. It's force equally extended, *ib.* 17. By it is explained the ſuction of animals, *ib.* 25. It's weight ſuſtains the column of mercury in the barometer, *ib.* 34. It's vaſt preſſure on the earth, *ib.* 38. It's elaſticity proved, *ib.* 39, 43. And differently accounted for, *ib.* 48. Is cauſed by fire, *ib.* 49. Is capable of raiſing great weights, *ib.* 41. The air in timber cauſes it to ſwim, *ib.* 47. Continued varieties in nature cauſed by air, *ib.* 48. It's elaſticity is always equal to the force which compreſſes it, *ib.* 51. It's elaſticity undeſtroyed, *ib.* 65. Air, expands by heat and contracts by cold, *ib.* 66, 67. Is the cauſe of winds, *ib.* 69. The benefits of freſh and cool air, *ib.* 70. Carries off ſmoke, *ib.* 71. Enlivens fire, *ib.* 73. Different currents of air in chimnies in ſummer time, *ib.* 82. Effects of condenſed air, *ib.* 85. Produces fountains and jets, *ib.* 88. Different calculations of the dilatation of air, *ib.* 89. Raiſes water 34 feet, *ib.* 94. Cannot be totally exhauſted from the receiver of the air-pump, *ib.* 108. The quantities of air exhauſted at every ſtroke are not equal, but are perpetually diminiſhed, *ib.* 111. The different methods of extracting it from the bodies which contain it, *ib.* 129. By heat, by cold, by exhauſtion, and by diſſolution, *ib.* 130. Air is contained in water, *ib.* 131. In eggs, *ib.* 132.

In wood, *ib.* The preſſure of it may produce the fineſt anatomical injections, *ib.* 134. Air condenſed retards fermentation, *ib.* 137. Air is a reſiſting medium, according to the ſurface expoſed, *ib.* 138. Supports the flight of birds, *ib.* 140. Is of great importance in the theory of gunnery, *ib.* 140. It's great reſiſtance to cannon balls, iii. 190. It's uſe in the animal œconomy, i. 141, 144. Is neceſſary for combuſtion, *ib.* 143. Is diminiſhed by combuſtion, *ib.* 146. Vaſt quantities are conſumed by fires and various means, *ib.* 148. Nouriſhes the blood, *ib.* 154. Paſſes into the bodies of birds, *ib.* 159. Is the medium of ſound, *ib.* 163, 165. Denſe air conveys the ſound beſt, *ib.* 166. Air is thrown into an undulating motion by ſound, *ib.* 168. In what manner the pulſes of the air are propagated by ſound, *ib.* 169. The various effects in the atmoſphere reſulting from the air, *ib.* 193. Connection between air and fire, *ib.* The benefits reſulting from air, *ib.* 196. Is a general agent, *ib.* 197. Hippocrates, his remark on it, *ib.* 197. Is not a ſolvent of water, *ib.* 317. Rarified air a cauſe of dryneſs, ii. 77. Very different currents of air in the atmoſphere, iii. 447. Hot air, it's power to raiſe weights, *ib.* 456. Air produced by fire and light, iv. 432. The upper regions of it extremely dry, *ib.* 515. See *Fire*, *Light*, *Water*. An account of the diſcoveries of the different airs, i. 423. The manner of conveying them from one veſſel to another, *ib.* 428. Methods of extracting air from ſeveral ſubjects, *ib.* 429.

Air, *alkaline acid*, it's nature and properties, i. 504.

Air, *atmoſpheric*, is a mixture of different fluids, i. 331, 465. Particularly of two elaſtic fluids of oppoſite qualities, *ib.* 468. Contains about 72 parts phlogiſticated air, and 28 parts vital air, *ib.* 469. Is an uniform compound, *ib.* 470. Air preſſes on fire, *ib.* Air ſupplies the fire, *ib.* 334. Vital air, on inflammation, diſengages much fire, *ib.* 335. Explanation of Argand's lamps, *ib.* 336. Air, it's effect on ignited iron, *ib.* 337. Contains great quantities of fire, *ib.* 408.

Air, *fixed*, it's nature and properties, i. 477, 486. Is found in ſubterraneous places, is produced from fermentations, *ib.* 478. From the reſpiration of animals, *ib.* 479. From various ſubſtances, *ib.* 480. It's effects when breathed by various animals, *ib.* 479, 480. Is abſorbed by water, *ib.* 481. The analogy between this and phlogiſton, *ib.* 518, 522.

Air, *fluor-acid*, an account of, i. 504.

Air, hepatic, an account of, i. 496. It's nature and properties, *ib.* 497.
Air, inflammable, it's nature and properties, how obtained, i. 487. Is produced from water by means of fire, *ib.* 490. Different manner of it's burning, *ib.* 493. Inflammable air from marſhes, *ib.* 499.
Air, cretaceous inflammable, how obtained, i. 499.
Air, pure inflammable, it's nature and properties, i. 493. Can form fire-works without ſmoke, *ib.* 495. Being mixed with different airs, it produces different colours, *ib.* 496.
Air, nitrous, obtained by the ſpirit of nitre poured on various metals, i. 471. Is a combination of phlogiſticated and vital air, *ib.* 472. It's nature and properties, *ib.* 474.
Air, phoſphoric, it's nature and properties, i. 498.
Air, phlogiſticated, called alſo azotic gas, or atmoſpherical mephitis, is variouſly obtained, i. 462. Is light, taſteleſs, inſoluble, *ib.* 463. Is improper for reſpiration or combuſtion, *ib.* 464.
Air, ſulphureous acid, it's nature and properties, i. 502.
Air, vital, it's ſingular effects on fire, i. 337. Amazingly increaſes it's power, *ib.* 394. An account of it, *ib.* 440. Is extricated by heat from various ſubſtances, *ib.* 441. Alſo by light from vegetables, *ib.* 443. But in different quantities, *ib.* 445. Water differently impregnated promotes the emiſſion of it, *ib.* 447. The quantity of it extricated is a teſt of the quantity of food taken in by the plant, *ib.* 449. Is extricated from ſome metallic calces, *ib.* 454. It's weight ſupports combuſtion, *ib.* 451. The change it produces on phoſphorus, *ib.* 452. Many combuſtible ſubſtances become acid by vital air, *ib.* 453. Metallic ſubſtances increaſe in weight as they abſorb vital air, *ib.* 454. It forms one third of the atmoſphere; is the acidifying principle, *ib.* 455. Is neceſſary for reſpiration, *ib.* 457. It takes from the blood it's ſuperabundant mephitis, and imparts it's own fire, *ib.* 457. The quantity of it abſorbed in reſpiration, *ib.* 458. It gives the red colour to the blood in the lungs, *ib.* 459. By reſpiration it paſſes from an aerial to a concrete form, and is the ſource of animal heat, *ib.* 460. It's effects when taken medicinally, *ib.* 461. Is a conſtituent part of certain bodies, *ib* 515.
Air pump, deſcription of, i. 5, 7. Hiſtory of, *ib.* 8. An account of it, *ib.* 5. An account of it's improvement, *ib.* 103. By Mr. Smeaton, *ib.* 105. By Mr. Prince, who removed the valves, *ib.* 106. Means to obtain accurate exhauſtion, *ib.* 121.
Analogy, the uſe of, in opening and informing the mind, ii. 144. Is uſed by our Lord, *ib.* 143. It's ſtability and excellence,

excellence, *ib.* 148. The analogy between the light of revelation and the light of the heavens, *ib.* 222.

Animals poſſeſs a natural language, i. 156. Retain the ſame degree of heat in different climates, *ib.* 219. The wiſdom exhibited in their form and magnitude, iii. 310.

Ancients ſuppoſed that nature dreaded a vacuum, i. 29. But this was confined within certain limits, *ib.* 30. Their knowledge in natural philoſophy, ii. 470. Their knowledge of glaſſes, *ib.* 481. The juſt ideas which ſome of them entertained of God, iii. 64. Their opinion of the ſoul, *ib.*

Archimedes ſet fire to the Roman ſhip at Syracuſe, by means of his burning glaſſes of plane mirrors, i. 390. ii. 233. His knowledge in hydroſtatics, iii. 371.

Ariſtotle, the influence of his authority, which impeded the progreſs of truth, i. 30. His idea of a plenum, iii. 34. His juſt remark concerning the Creator, iv. 291.

Arithmetic, mechanical, principles of, iii. 276.

Armillary ſphere, iii. 543. The appearances of the ſtarry heavens illuſtrated by it, *ib.* 560.

Aſtronomy, obſervations on; it's deſign, iii. 513, 514. It's general principles, *ib.* 515. Corrects appearances, iv. 1. Copernican ſyſtem, *ib.* 2, 177, 178. Ptolemaic, *ib.* 3. Remarks on phyſical aſtronomy, *ib.* 245. The different analogies of the heavenly motions which have been pointed out, *ib.* 245, 246. Kepler's laws of it, iv. 257.

Atmoſphere, height of, manner of aſcertaining it, i. 532. Does not refract light above 45 miles, *ib.* 54. The height not accurately known, *ib.* 55. Horſley's conjecture concerning it's infinitude, *ib.* 57. Is a mixture of all vegetable, mineral, and animal ſubſtances, *ib.* 192. Great cauſes always acting in it, iv. 475.

Atoms, conſiderations concerning them, iii. 13. Are indiviſible, *ib.* 14. Are indefinitely ſmall, *ib.* 17.

Attraction, how differently uſed by authors, iii. 24, 25. Obſervations on it, *ib.* 29. How falſely applied, *ib.* 30. Inſtances of attraction otherwiſe explained, *ib.* 32. In a column of quickſilver, *ib.* 34.

Attraction of coheſion examined, i. 534.

Aurora borealis, the different appearances of, iv. 542. It's flaſhes croſs the magnetic meridian at right angles, *ib.* 543. Where they converge, *ib.* 544.

B

Bacon, Friar, is said to have discovered the telescope, ii. 479. His superior character and attainments, *ib.* 480.

Bacon, Lord; his reflections on the philosophy of Aristotle, i. 30, 31. Discovered the elasticity of the air, *ib.* 40. His observations on the senses, *ib.* 201. On the tendency of true philosophy, *ib.* 240. On the scriptures and the creatures, *ib.* 241. On second causes, *ib.* 242. His method of reasoning on natural philosophy; his novum organum, ii. 98. His uncommon merit; his character of a true philosopher, *ib.* 99. His account of the idols of the mind, *ib.* 102. The idols of the tribe, *ib.* 103, 110. Idols of the cave, *ib.* 110, 115. The idols of the market, *ib.* 115. The idols of the theatre, *ib.* 116. His account of different erroneous systems; the sophistical, *ib.* 117; the empirical, and the superstitious, *ib.* 118. His new logic, or art of interpreting nature, *ib.* 134. His comparison of natural philosophy to a pyramid, *ib.* 136. His suggestions for a history of winds, iv. 530.

Ballance, it's properties, iii. 278. How it should be constructed, *ib.* 279. It's fulcrum, *ib.* 280. The axis to be placed higher than the center of gravity, *ib.* 282. Helsham's property of the ballance, *ib.* 284.

Balloons, air, iii. 442. Dr. Black and Mr. Cavallo discovered the principle of them, *ib.* 444. Was discovered and also executed by the Montgolfiers, with rarified air, *ib.* 445. The first ascended from Paris, with M. Pilatre de Rozier and the Marquis d'Arlandes, *ib.* 446. Of air-balloons filled with inflammable air, *ib.* 447. Description of them, *ib.* 448. An account of different excursions made in them by Messrs. Charles and Roberts, and Mr. Baldwyn, *ib.* 450. Will rise from only the rarifaction of common air, *ib.* 457. Collect many vapours in the atmosphere, *ib.* 458. Are unmanageable from their size, *ib.* 459.

Barometer, arose from the Torricellian vacuum, i. 29. The manner of filling it, *ib.* 32. Was first used by Pascal, to measure mountains, *ib.* 33. Applied as a guage to the air-pump, *ib.* 34. On the best form for it, iv. 478. The principal requisites of a good barometer, *ib.* 481. To boil the mercury in the barometer tube, *ib.* 482. It requires a guage to regulate the quantity of mercury in the cistern, *ib.* 484, 490. Is influenced by heat and cold, *ib.* 485. Of the portable barometer; how to use it, *ib.* 487. It's defects, *ib.* 488 Of the best portable barometer, *ib.* 489. How to use it, *ib.* 490. Of the scale of correction of the excesses of heat and cold, and their influence on the barometer,

barometer, *ib.* 491. Mr. de Luc's remarks on them, *ib.* 559. The variations diminiſh as you approach the equator, *ib.* 560. Remarks from the barometer, *ib.* 561. 565.

Battery, electrical, iv. 362. Cautions in the uſing it, *ib.* Effects produced by it, *ib.* 363. 367.

Battering rams of the ancients, iii. 110.

Bell, the manner of it's founding explained, i. 166, 167.

Birds, the manner of their flying, i. 139. iii. 129. Proviſion made for this, in the air paſſing from their lungs into every part of their bodies, i. 159.

Black, Dr. his doctrine of latent and ſenſible heat, i. 269. His experiments on the melting of ice, *ib.* 273. His diſcoveries of airs, *ib.* 425.

Blindneſs, calamity of, ii. 267.

Blood is purified in the lungs, and nouriſhed by air; receives it's vermilion colour from vital air, i. 458, 459.

Boerhaave, his idea of fire, i. 211.

Bones, their great ſtrength, iii. 347.

Boyle, Hon. Mr. his diſtinguiſhed character, i. 9.

Breezes, land and ſea, an account of them, iv. 538.

Buffon, by plane mirrors burnt planks at a diſtance, ii. 230.

Burning glaſſes, or convex lenſes, collect the rays of the ſun, ii. 193. Were known to the ancients, *ib.* 194. Effects produced by M. Tſchirnhauſen's burning glaſs, *ib.* 195. Mr. Parker obſerved a rotatory motion in the rays at the focus of his burning-glaſs, *ib.* 196.

C.

Camera obſcura, it's conſtruction and uſe, ii. 197. Obſervations upon it, *ib.* 203.

Cataract in the eye, how cauſed, ii. 333. Means uſed to diſperſe it, ii. 331.

Catoptrics, on the laws of reflection of light, ii. 152.

Center of the ſolar ſyſtem, iv. 277.

Charcoal, reaſonings upon experiments made with it, for and againſt phlogiſton, i. 514. Mr. Lavoiſier's miſtakes, from conſidering it as a ſimple principle, *ib.* 517.

Chimnies. High chimnies draw beſt, i. 74. Cauſes of chimnies ſmoking, *ib.* 75. The want of a freſh current of air, *ib.* 76. Chimnies too large, *ib.* 77. Funnels too ſhort, *ib.* 78. The action of two chimnies on each other, *ib.* The poſition of the room door, *ib.* 79. Communication of funnels, *ib.* Narrowneſs of funnels, *ib.* 80. Low ſituation of the houſe, *ib.* Violence of winds, *ib.* 81. Chimnies modern inventions, *ib.* 83.—See *Air, Fire.*

Clarke, Dr. his idea of the cauſe of motion, iii. 245.

Clocks

Clocks differ in different degrees of heat, i. 221. The principles on which they are conſtructed, iii. 215. Their irregularities, *ib.* 218.

Clouds, indications of the weather from them, iv. 563.

Coals, objections againſt them at firſt, *i.* 83.

Cohesion is produced by fire, i. 237.

Cold, artificial, accounted for, i. 277. Cold is produced by the abſorption of fire, *ib.* 307. It depends on the degree and the rapidity of the evaporation, *ib.* 310.

Cold is the ſenſation cauſed by fire paſſing from one body to another, i. 245. Effects of extreme cold on the animal frame, ii. 40. Produces great ſterility, *ib.* 41. It is not extreme cold, but humidity, which is fatal to plants, *ib.* 47. The extreme degrees of cold, *ib.* 52. On the ſources of cold, iv. 546 to 548.—See *Fire*, *Evaporation*.

Colliſion, a means of exciting fire, i. 383. Effects produced by this, *ib.* 384. It's uſe in New Holland, *ib.* 385.

Colours differently abſorb the rays of heat, i. 322. The colouring ſubſtance is formed by the agency of light on the vegetables, *ib.* 358. On different tints of the rays of light, ii. 358. Sir Iſaac Newton's theory of light and colours, *ib.* 359.—See *Newton*. The ſeven colours exhibited by the priſm, *ib.* 362. The order of the colours, *ib.* 363. The rays of different colours are of different refrangibility, *ib.* 366. The colours of the rays are not changed by refraction, *ib.* 367, 377. The due mixture of the primary colours produces whiteneſs, *ib.* 375. Illuſtrated, *ib.* 377. The ſimilarity between the ſeven primary colours, and the ſeven notes in the ſcale of muſic, *ib.* 380. Different experiments on colours with the priſm, *ib.* 382. Illuſtrated by the phenomenon of the rainbow, *ib.* 387. The different colours appear under different angles, *ib.* 392. The different colours obſerved in a ſoap-bubble, *ib.* 394, 399. On the circles ſeen in glaſs plates, *ib.* 395. Different colours exhibited by reflected or by tranſmitted light, *ib.* 397. The colours of bodies depend, in ſome degree, on the thickneſs of the particles that compoſe them, *ib.* 400. The colours of different bodies ariſe from their reflecting one colour, and imbibing all the reſt, *ib.* 404. The colours tinging ſhadows in ſummer explained, *ib.* 408. The colours of the atmoſphere, clouds, &c. *ib.* 409. The excellency of the colours uſed by the ancients, *ib.* 411. Mr. Delaval found that the tinging matter of all vegetables was always black when viewed by reflection, *ib.* 414. The colouring particles of bodies appear black when they are denſe, *ib.* 416. When the colouring matter is extracted from vegetables, &c. they appear white, *ib.* 417. Colours are deſtroyed

by the rays of the ſun, *ib.* 418. Animal and metallic colours are produced in the ſame manner as vegetable, *ib.* 421. The production of colour depends on fire, *ib.* 426. Colours are emitted from ſome phoſphoric ſubſtances, *ib.* 439. They are produced by fire, *ib.* 440. Are not ſenſations, but ſecondary qualities of bodies, *ib.* 472.—See *Light, Fire.*

Colure, equinoctial and ſolſtitial, iii. 555.

Combuſtion, an effect of fire, i. 328. The requiſites for combuſtion, *ib.* 330. In combuſtion, the pure air is converted into fixed air and aqueous vapours, and gives out it's fire, *ib.* 408.

Comets are regular parts of one great ſyſtem, iv. 235. Their uſe unknown, and the knowledge of them imperfect, *ib.* 236. Their number, orbits and motion, velocity and ſize, *ib.* 237. Their form and tails, *ib.* 238.

Conductors, and non-conductors, of electricity, iv. 303.

Congelation, phenomenon of, explained, i. 275.

Conſtellations. See *Stars.*

Copernicus, his ſyſtem, iv. 1. Was probably known to the ancients, *ib.* 2. A view of it, *ib.* 6. The truth of his ſyſtem proved by the planetarium, *ib.* 177, 178.

Crawford, Dr. his excellent treatiſe on animal heat, i. 396, 407; and on combuſtion, *ib.* 408.

Creation, remarks on it, iv. 430. The order of it, *ib.* 433. Is a theatre for the divine goodneſs, *ib.* 434.

Cruelty to animals juſtly condemned, i. 144.

Cryſtallization explained, i. 380.

Cupping, the nature and operation of it, i. 18.

D

Dalton, Mr. his account of the aurora borealis, iv. 542. His remarks on the weather from the barometer, *ib.* 560.

Darkneſs at our Saviour's crucifixion ſupernatural, iv. 132.

Day, aſtronomical or ſolar, iv. 151. Sideral, *ib.* 153.

Delaval, Mr. his experiments on the permanent colours of opake bodies, ii. 410. He found that in tranſparent coloured ſubſtances, the colouring matter does not reflect any light, *ib.* 413. An account of his experiments, *ib.* 414. He concludes that the colouring particles do not reflect any light, but that objects are reflected by a medium diffuſed over the ſurfaces of the plates, *ib.* 415. His obſervations on the colours of animal, earthy, and metallic bodies, *ib.* 420, 421.—See *Colours, Light.*

Deſcartes, his error concerning the univerſe, iii. 24.

Digits, iv. 149.
Diodorus Siculus, his weak idea concerning the ſpeech of men at the beginning, i. 156.
Dioptrics, or the laws of refraction, ii. 152.
Diſcoveries of printing, mariner's compaſs, gunpowder, ii. 433.
Diſtance, the appearance of, depends on the brightneſs of objects, ii. 339. On the number of intervening objects, *ib.* 341. Different degrees ſuggeſted by different apparent magnitudes of objects, *ib.* 343.
Diving bell, deſcription of Dr. Halley's, iii. 462. The improvement of this by Triedwald, *ib.* 464; by Mr. Smeaton, *ib.* 465.
Diving cheſt, invented by Mr. Smeaton, iii. 465.
Dollond, Mr. John, the inventor of the achromatic teleſcope, ii. 520. The principles on which it is founded, *ib.* 524. The diſcovery attributed to Euler, *ib.* 525.

E

Earth, the equatorial diameter greater than the polar diameter, iii. 44. It's ſize, motion, diſtance, &c. iv. 24. It's revolution; it's figure, *ib.* 49. The proofs of this, *ib.* 50. It's diurnal motion, *ib.* 53. The reaſons for this, agreeable to analogy, *ib.* 55. The phenomena ariſing from this diurnal motion, *ib.* 56. Is half illuminated at a time, *ib.* 58. Of the earth's annual motion, *ib.* 61. It partakes of various degrees of heat and cold, *ib.* 77. The earth enlightens the moon, *ib.* 110. The ſhadow of the earth forms a cone, *ib.* 114. The eclipſes of it, *ib.* 121. It's monthly motion about the common center of gravity between that and the moon, *ib.* 192. The matter of earth, how formed, *ib.* 432. The uſe of the earth, *ib.* 434. The magnetiſm of the earth, *ib.* 456. Earth a ſource of heat, iv. 545. Diſtance from it a cauſe of cold, *ib.* 546. The excellency of it's diſtribution into ſeas and mountains, *ib.* 553.
Ebullition is cauſed by the action of fire on the bubbles of air in any fluid, i. 297.
Echo, nature of, i. 177. Explanation of it's effects, *ib.* 181. — See *Sound*.
Eclipſes were formerly ſuperſtitiouſly regarded, iv. 112. Are explained, *ib.* 113. Of the moon, *ib.* 114. Eclipſes total and central, *ib.* 115. Of their limits, *ib.* 128. Of their periods, *ib.* 129.
Ecliptic, the ſun's annual path, iii. 539. The obliquity of this, *ib.* 540. Is divided into twelve ſigns of thirty degrees each, *ib.* 553.

Erles, Mr. his ſyſtem of electricity, iv. 305.
Eggs, incubation of, greatly aſſiſted by means of air, i. 132.
Elaſticity (ſee *Air*, *Water*,) is cauſed by fire, i. 49. Elaſticity of bodies, iii. 230. Suppoſed to be cauſed by motion, *ib.* 231. It's effects in different handy-works, *ib.* 238. In gunnery and rockets, *ib.* 299.
Electricity firſt diſcovered in amber, iv. 299. The uſes derived from it, *ib.* Is a fluid univerſally diffuſed, *ib.* 300. Electrical appearances, *ib.* 302. Electricity is *vitreous* or *reſinous*, *ib.* 303, 304, 305, 307, 309, 310, 316, 324, 343, 344. Theſe are two diſtinct and active powers, *ib.* 305. They exiſt together conjoined, in their natural ſtate, *ib.* Electricity is from the ſeparation of theſe two powers, *ib.* 306, 310. Electrical atmoſphere, *ib.* 307. Of the electrical machine, and it's mode of action, *ib.* 309, 311. Cautions in uſing it, *ib.* 312, 313. Conductors muſt be inſulated before they are electrified, *ib.* 310. The brilliancy of the ſpark depends on the preſſure of the atmoſphere and medium, *ib.* 311, 332. The ſolar and electric fluid are probably the ſame, *ib.* 314. On the momentum of it's force, *ib.* 315. On it's attraction and repulſion, *ib.* 315. On the afflux and efflux of the two powers, *ib.* 320. Gives a rotatory motion to ſmall light balls, *ib.* 321. The electric fluid is univerſally diſſeminated, and in continued action, *ib.* 323. The ſmalleſt motion in nature diſturbs it's equilibrium, *ib.* 324. Obſervations on Franklin's ſyſtem of electricity, *ib.* 325. On the electric ſpark, *ib.* 329. On the uſe of points, *ib.* 330. The electric ſpark will fire ſpirits of wine, *ib.* 334. The ſparks are of different colours, *ib.* 335, 353. Motions produced by electricity, *ib.* 336. Promotes evaporation, *ib.* 337. Is a ſubject of general curioſity, *ib.* 339. To aſcertain the quantity of the electric matter, *ib.* 341. The powers are reciprocally exchanged, *ib.* 347. It melts wires, beginning in the middle, *ib.* 353, 366. The electric matter is only luminous in a divided ſtate, *ib.* 355. It perforated a quire of paper in oppoſite directions, *ib.* 363. Is diſcovered in rain, hail, ſnow, *ib.* 373. The immenſe quantity of it, *ib.* 377. Is real matter, proved, *ib.* 384. It's reſemblance to fire and light, *ib.* 385, 387. It produces heat, *ib.* 386; and accelerates evaporation, *ib.* 387. Is communicated by the ſame ſubſtances which communicate heat, *ib.* 388. Electricity is procured by heat and by liquifaction, *ib.* 389. Raiſes the thermometer, *ib.* 390. The electric ſtate of the air in Ruſſia, *ib.* 392. Heat in ſummer becomes electric fluid in winter, *ib.* 393. Luminous experiments, *ib.* 394. The ſimilar effects on the ſolar and electric light, by different media, *ib.* 399. On animal

animal electricity; electricity the principle of animal heat and motion, *ib.* 412. The electric fluid and the solar fire are the same, *ib.* 416. It's agency in animated nature, *ib.* 419. It's influence on health and our feelings, *ib.* 420. Remarks on animal electricity, *ib.* 421. Electricity may be the same as the animal spirits, *ib.* 423. Experiments and results from animal electricity, *ib.* 426, 428. Remarks on atmospherical electricity, *ib.* 554. It's diurnal variations, *ib.* 556.—See *Sun*, *Fire*.

Electrometer, that described by Mr. Bennet, iv. 323. Experiments with it, *ib.* 324, 554.

Elements, active and passive, iv. 411. The importance of this agency, iv. 472.

Engines, constructions of different sorts, iii. 311. Compound engines, *ib.* 313. How to compute their powers, *ib.* 315.

Equator, of the, iii. 521, 550.

Equinoxes, precessions of, iv. 149.

Ether, by evaporation, is capable of freezing water, ii. 49. Reduced mercury 29° below the freezing point, *ib.* 50.

Evaporation an effect of fire, i. 289. Different effects resulting from it, *ib.* 293, 308. Cools liquors, *ib.* 298. Is the same in open air and in vacuo, *ib.* 300. Evaporation of ether freezes water, *ib.* 309. Effects of it, *ib.* 311. Produces ice in the East Indies, *ib.* 312. It's effects on the health of the body, *ib.* 313. Spontaneous evaporations are also caused by fire, *ib.* 318. And are assisted by motion, *ib.* 319. Evaporation proceeds from grass, vegetables, trees, and shrubs, *ib.* 320. In a certain degree it contributes to health, *ib.* 321. Laws of evaporation by M. de Luc, ii. 80. Is a dissolution of water by fire, iv. 506. Is a great source of cold, *ib.* 547. Remarks on evaporation, *ib.* 549.—See *Fire*, *Water*.

Experimentalist, character of, i. 126, 127, 129.

Eye, greatly assisted by optical instruments, ii. 150. Can be adapted to very different degrees of light, and size of objects, *ib.* 168. Benefits derived from it, *ib.* 266, 288. Short description of the eye and it's various parts, external and internal, *ib.* 268. It's orbit, brows, *ib.* Of the two eye-lids, *ib.* 269, 272. Of the lachrymal gland, *ib.* 272. Of the muscles of the eyes, *ib.* 273. Of the motions of the eye, *ib.* 275. Of it's globe, *ib.* 277. Of it's coats, sclerotica, choroides, *ib.* 278. Of the iris, *ib.* 279. The pupil, *ib.* 280. Of the retina, *ib.* 281. Of the optic nerve, *ib.* 282. The advantages derived from two eyes, *ib.* 274. Of the three humours, *ib.* 282. The aqueous, *ib.* 283. The chrystalline, *ib.* 284. And the vitreous, *ib.* 285. Of the ligamentum ciliare, *ib.* 286.

Of

Of the artificial eye, *ib.* 292. The different degrees of ſenſation in different people, *ib.* 303. Diſtinct viſion formed on the retina and near it, *ib.* 307. The eye accommodates itſelf to different diſtances, *ib.* 310, 337. Illuſtrated, *ib.* 311. How accounted for by various authors, *ib.* 312. The eye ſees beſt when ſurrounded by darkneſs, *ib.* 317. Is enabled to ſee with a very ſmall quantity of light, *ib.* 318. Of the defects of the eye; of the long-ſighted, *ib.* 319. Of the accidental conformations of the eye by habit, *ib.* 322. Rules for preſerving the ſight, *ib.* 325. Maladies of the eyes, how occaſioned, *ib.* 326. Two remarkable caſes, *ib.* 327. Of couched eyes; require convex glaſſes, *ib.* 331. It's powers are limited, *ib.* 338. Miſtakes made by thoſe who have but one eye, *ib.* 339. The analogy between the eye and the underſtanding, *ib.* 346. Reflections on the wonderful powers of the eye, *ib.* 355. Eyes of animals differently phoſphoretic, *ib.* 437.—See *Light*.

F

Fire produces elaſticity, i. 50. Fire and air are different conditions of the ſame elementary matter, *ib.* 194. Plato's idea of it, *ib.* 198. The different opinions entertained of it by the ancients and moderns, *ib.* 203. Proved to be a real material ſubſtance, acting in a fluid form, *ib.* 204, 205, 213. Is not created by motion, *ib.* 206. Is the cauſe of heat, *ib.* 210. *Abſolute* heat and *relative* heat, *ib.* 214. Boerhaave's idea of fire; is univerſally diffuſed, *ib.* Penetrates all bodies, *ib.* 212. Continually tends towards an univerſal equilibrium, except in animal bodies, *ib.* 213, 219. Is differently conducted in different bodies, from their different capacities of retaining it, *ib.* 214. Is retarded by ſolt ſubſtances, *ib.* 215. Is rapidly conveyed by fluids, *ib.* 216. Dilates all bodies, *ib.* 220. *Liberated*, *manifeſted*, or *thermometric* fire, *ib.* 220. Different metals are differently expanded by fire, *ib.* 222. The very great force of fire in expanding them, *ib.* 232. Fire the grand agent in nature to diſſolve and to unite all things, *ib.* 234, 235. Proved to be the cauſe of coheſion, *ib.* 238. Acts in two different modes, by dilating and by compreſſing, *ib.* 239. Is the cauſe of cold, which is occaſioned by fire paſſing from one body to another, *ib.* 245. Latent fire, *ib.* 252. A method to diſcover the quantity of fire contained in different bodies, *ib.* 253 to 256. The action of fire depends on the re-action of the incumbent air, *ib.* 264. Fire is the

the cauſe of fluidity, *ib.* 267. Is extricated whenever water is congealed, *ib.* 276. Was formerly made an object of worſhip, *ib.* 288. Is a fluid never at reſt, *ib.* 289. Is the cauſe of vapours, *ib.* 289. It's extreme violence when confined, *ib.* 290. Is the cauſe of ebullition, *ib.* 293. Much fire is abſorbed in vapours, *ib.* 301. Fire expands or ſeparates the parts of water, *ib.* 305. Specific fire of any body, *ib.* 306. Fire is differently abſorbed by different coloured ſubſtances, *ib.* 322. See *Colours.* Fire maintains it's dimenſions, although greatly preſſed by the air, *ib.* 333. The general effects it produces acting on different ſubſtances, *ib.* 360. Man alone underſtands the uſe of fire, *ib.* 367. It's effect on gunpowder, *ib.* 370. On fulminating powder, *ib.* 374; and fulminating ſilver, *ib.* 375. Produces ſolutions, *ib.* 376. Chryſtallization, *ib.* 380. Clarification, *ib.* 381. Odours, *ib.* 382. Fire is collected by colliſion, *ib.* 383. By fermentation, *ib.* 387. By putrifaction, *ib.* By the action of the ſolar rays, *ib.* 388. By the reſiſtance of the parts of a body on which light falls, *ib.* 390. Methods of increaſing or diminiſhing the action of fire, *ib.* 393. Different bodies contain different quantities of fire, *ib.* 398. Fire conſtantly tends to diffuſe itſelf over all bodies, till they are brought to the ſame temperature, *ib.* 399. It is contained in all bodies at the common temperature of the atmoſphere, *ib.* 400. Atmoſpherical air contains a great quantity of fire, *ib.* 407. Fire is diſtinguiſhed into *diffuſible* and *conſtitutional*, *ib.* 410. It's agency in vegetation, *ib.* 413. Was repreſented by Vulcan in the ancient mythology, *ib.* 415. Was perverted into idolatrous worſhip, *ib.* 418. Cauſes the grand differences in bodies, *ib.* 431. Is diſtinguiſhed into ſenſible heat, the latent fire of fluidity, and the latent fire of elaſticity, *ib.* 431. Opinion of the ancients on fire; of Plato, *ib.* 524. Of Zeno, of Hippocrates, *ib.* 525. Of the Pythagoreans, iv. 417. Fire is imponderable, ii. 57. Fire is the agent of all diſſolution, *ib.* 69. Great quantity of fire is requiſite to raiſe water into ſteam, *ib.* 71. Is ſubject to the ſame laws of reflexibility and refrangibility as the rays of light, *ib.* 243. Is the means of producing colours, *ib.* 426. Is retained in many bodies under the form of heat and light, *ib.* 428. Fire is neceſſary for producing the priſmatic colours, *ib.* 440. The ſimilarity between fire and light, *ib.* 462. Is the moſt important agent in nature, iv. 402. Natural life depends on it's activity, *ib.* 402, 410. Is the active element within all bodies, *ib.* 406. Has been called by different names, *ib.* 407. Is every where preſent, *ib.* 408. Is only an inſtrumental cauſe,

cause, *ib.* 411. It's effects on the heart, *ib.* 414. It's influence in the animal œconomy, *ib.* 415. On this depends the health and activity of animals and plants, *ib.* Theophrastus's opinion on fire, *ib.* 418. The various effects produced by it, *ib.* Elementary fire, or the matter of light, first formed, *ib.* 432. Fire, it's expansive power, *ib.* 493.—See *Light*, *Heat*, *Colours*.

Fishes, the manner of their breathing, i. 160. Their manner of swimming, iii. 130.

Flame, an account of, i. 338. On the flames of candles and lamps, *ib.* 341.

Fluids of the least density expand most by heat, i. 233. Are caused by a degree of fire, iii. 374. Are not to be explained on mechanical principles, *ib.* 375. Their gravity in propria loco, *ib.* 376. The parts of a fluid gravitate independently of each other, *ib.* 377. The surface of fluids is on a level, *ib.* 378. Their pressures, *ib.* Fluids press in all directions, *ib.* 379. On their action against vessels of different sizes in which they are contained, *ib.* 381, 385. The hydrostatic paradox, *ib.* 387. On the action of fluids on bodies immersed in them, *ib.* 391. Fluids, when deep, press equally on all sides of a body, *ib.* 395. Bodies sink if specifically heavier, or swim if lighter, than the fluid, *ib.* 398, 399. If of the same gravity, will remain in any part of the fluid, *ib.* 400. The weight lost by a solid immersed in a fluid is communicated to the fluid, *ib.* 407. Their spouting through small orifices, iii. 467. The velocity is as that of a heavy body falling from a similar height, *ib.* 468. The quantities discharged, *ib.* 469. The water contracts in flowing out, *ib.* 472. Of the discharge of fluids through additional tubes, *ib.* 474. Of jets d'eaus; they never rise to the height of the reservoir, *ib.* 479. The position of the ajutage *ib.* 480. Of the motion of fluids in conduit pipes, *ib.* 496. The friction retards the velocity, *ib.* 497. If the pipes are curved, the discharge is less, *ib.* 498. Of the vibratory motion in fluids, *ib.* 501. Of the oscillatory motion of waves, *ib.* 502. Of the resistance of fluids, whether at rest, or in motion, *ib.* 504. Mistakes of the moderns concerning this subject, *ib.* 505. Their ignorance of it, *ib.* 506.—See *Fire*, *Heat*.

Fluids, elastic, are combinations of fire with given substances, i. 432. M. Lavoisier's mistakes concerning them, *ib.* 438, 438. M. de Luc's observations on them, *ib.* 459. The difference between these and vapours, iv. 504.

Fluidity is caused by heat, i. 268. Absorbed or combined with the fluid substance, *ib.* 270.

Focus, real or imaginary, ii. 171.

Forces, of the compoſition or reſolution of forces, iii. 119.
Forces, deflecting, of, iv. 258. Central forces, *ib.* 259.
Frame, human, imbibes water from the atmoſphere to ſupply the animal moiſture, ii. 10. The great quantities of this daily exhaled, *ib.* 11.
Franklin, Dr. his ſyſtem of electricity, iv. 305. Obſervations on his theory, iv. 325, 329. His principles, *ib.* 326. The negative and poſitive electricity denied, *ib.* 327.
Friction, iii. 333. Is an uniformly retarding force, *ib.* 336. It does not increaſe equally with the quantity of matter, *ib.* 337. The ſmalleſt ſurface has the leaſt friction, *ib.* 338. General obſervations on frictions, *ib.* 340, 342.
Fulminating powders, their nature and operations, i. 374, 375.
Furs, their property of retaining heat, i. 218.

G

Cages for the air-pump, i. 113. Their very different reſults, *ib.* 117. Explained by Mr. Cavendiſh, *ib.* 118.
Galen, his juſt remark on praiſe, i. 150.
Galileo could not diſcover the reaſon why water could not be raiſed by a pump above 32 feet, i. 30. Diſcovered the teleſcope, ii. 478. Applied the pendulum to meaſure time, iii. 201.
Gas, inflammable carbonic, an account of, i. 498.
Gas, muriatic acid, it's nature and properties, i. 500.
Gas, muriatic dephlogiſticated, an account of it's effects, i. 501. Deſtroys all vegetable colours, *ib.* 502.
Gaſes, permanently elaſtic fluids, i. 431. Are of different kinds, *ib.* 493.
Georgium Sidus, was diſcovered by Dr. Herſchel, iv. 35. It's ſize, diſtance, revolution, *ib.* 37. It's moons, *ib.* 37. The length of it's year, *ib.* 170.
Glaſs, it's various uſes, ii. 184. Different kinds of, ii. 523.
Globe, new terreſtrial, the advantages of it, iv. 197. The abſurdities reſulting from the old ones, *ib.* 199. The conſtruction and uſe of this new globe, *ib.* 200. How to rectify this globe, *ib.* 201. New celeſtial globe, *ib.* 202.
Glow-worm, an account of the light in it, iv. 425.
God, the ſource of all truth, i. 123. The author of ſpeech, *ib.* 156. His end in creating the univerſe, the greateſt poſſible good, *ib.* 197. The author of all good to man, *ib.* 241. Is clearly indicated by final cauſes, *ib.* 281. His univerſal goodneſs, *ib.* 419. Is the fountain of beauty, *ib.* 422.

The great ruler over all his works, ii. 96. Manifests himself through nature, *ib.* 97. The immensity of his works, *ib.* 129. Is the sun of the intellectual world, *ib.* 144. Is the author of nature, *ib.* 259. The character of the Saviour, as delighting to communicate wisdom, *ib.* 412. His divinity and character, *ib.* 474, 475. The infinity of his works, *ib.* 477. Are now seen in obscurity; the energies of the divine mind are manifested in outward nature, *ib.* 560. Has impressed on matter some faint characters of his own beauty, iii. 63. The ancients thought him to be goodness itself, and truth itself, *ib.* 64. The perfection of his wisdom, *ib.* 79. A hymn to his praise on the excellency of the soul of man, *ib.* 86, 88. His wisdom and power, as the divine mechanic, *ib.* 91; displayed in the natural and moral world, *ib.* 92, 93. Time cannot be predicated of him, *ib.* 221. God the original cause of all motion, *ib.* 255. His mercy, wisdom, and power, are discoverable in his works, *ib.* 511. He alone sees the whole of nature, *ib.* 512. His divine love produced and supports all things, *ib.* 578, 579. He is continually providing for the happiness of his creatures, iv. 5. Supports and feeds the creatures he has made, *ib.* 208. Employs nature as a stupendous engine to accomplish various ules, *ib.* 210. He is glorified by the inhabitants of innumerable worlds, *ib.* 241. Has probably peopled all the planetary worlds, *ib.* 243; and also redeemed their inhabitants, if fallen, *ib.* 244. Is the real cause who governs the mundane system, *ib.* 256. The knowledge of him is the most excellent wisdom, *ib.* 291. He is one, Jesus Christ, *ib.* 292. His universal government, *ib.* 293. Is invisible to us, *ib.* 294. Is praised by all things which he has made, *ib.* 295. His perfections seen in his works, *ib.* The manner and the end of creation, *ib.* 433. The perfection of his word and work, *ib.* 571, 572.—See *Providence, Nature, Man.*

Gravity, and *gravitation*, an enquiry whether it is an essential property of matter, iii. 21. Considered as a fact, *ib.* 37. The proportion in which the force of gravity decreases, *ib.* 39. Gravity acts universally, but not uniformly in all places, *ib.* 40. A body falls about an hundred and ninety-three inches in a second of time, *ib.* 43. The difference respecting gravity resulting from different positions on the globe, *ib.* 43. Gravitation extends to the planets, *ib.* 45. Reflections on gravity as a law, *ib.* 46. Gravity considered as a *resisting* and as a *moving* power, *ib.* 47. The weight of bodies is not in proportion to their quantities of matter, *ib.* 47. Powers acting contrary to gravity, *ib.* 49; observed in plants and light, *ib.* 50.

Of the center of gravity in bodies, *ib.* 163. Of the center of gravity in the human body, *ib.* 167. Cautions arising from it, *ib.* 168. Of the situation of the center of gravity, *ib.* 172. To find the center of gravity of a trapezium, *ib.* 173; of a pyramid, *ib.* 174. General observations on gravity, *ib.* 179. It extends to the moon, iv. 282. It produces a small irregularity in the motion of the planets, *ib.* 279.

Gravity, specific, of bodies, iii. 392; is as their density, *ib.*; is measured by water, *ib.* 394. All bodies immersed in fluids lose the weight of an equal bulk of that fluid, *ib.* 402. How to obtain the specific gravity of bodies, *ib.* 411. To find the specific gravity of *solids*, *ib.* 417. If heavier or lighter than water, *ib.* 419. Of *fluids*, *ib.* 421. Different methods of ascertaining the specific gravity of fluids, *ib.* 436. A table of specific gravities, *ib.* 438, 439. Of several fluids in summer and winter, *ib.* 441.

Green colour, the universality and excellency of it, ii. 356.

Gunnery, the great difference between theory and practice, iii. 180. Mr. Robins's application to this art, *ib.* 189. The imperfections in this art, *ib.* 191.

Gunpowder, the substances which compose it, i. 371. Manner of making it, *ib.* 372. Derives it's force from vital air, *ib.* An estimate of it's expansive force, *ib.* 373.

H

Hail is water suddenly congealed, ii. 44.

Halley, Dr. his weak solution concerning the saltness of the sea, ii. 27. His hypothesis to explain the variations of the needle, iv. 463.

Happiness to be obtained by religion, i. 101.

Heart, it's situation, and mutual action with the lungs, i. 153.

Hearts, of different creatures, in what manner affected by heat, iv. 424.

Heat, the effect of fire, i. 210. *Absolute* and *relative*, the difference between them, *ib.* 211. Is conveyed through a medium more subtle than common air, *ib.* 213. *Animal* heat remains universally the same, although under the most opposite circumstances, *ib.* 219. The degree of heat is measured by the thermometer, *ib.* 246. Different subjects receive different degrees of heat, *ib.* 258. The progression of heat not easily ascertained, *ib.* 259. The relative heat in different bodies marked by Mr. Jones, *ib.* 262, 263. *Latent* and *sensible* heat, *ib.* 270, 305. More than eight hundred degrees of heat are absorbed in steam, *ib.* 303. Heat counteracts the influence of gravitation, *ib.*

363. The quantity of heat is diminiſhed by the change it undergoes in the lungs, *ib.* 405. Light and heat are different modifications of the ſame matter, *ib.* 445. Without heat bodies do not emit light, *ib.* 447. The different ſources of heat, iv. 544, 545.—See *Sun*, *Fire*, *Thermometer*.

Herſchell, Dr. his diſcoveries of new ſtars, ii. 478. His idea of the conſtruction of the univerſe, iv. 217. That the viſible univerſe is only a nebula, *ib.* 218. Concerning a ſiderial ſtratum, *ib.* 219. The great powers of his teleſcope, *ib.* 223. On the origin of nebulous ſtrata, *ib.* 224. Diſcovered volcanoes in the moon, *ib.* 231.—See *Stars*, *Moon*.

Hippocrates, his admirable obſervations on air, i. 197.

Hire, *M. de la*, his experiments on the diſtance which rain-water penetrates into the earth, ii. 19, 21.

Horizon, iii. 5. 21. It's uſes, *ib.* 545. Is divided into rational and ſenſible, *ib.* 546.

Horſes, their advantage in drawing from their weight, iii. 353.

Horſley, Biſhop, his conjectures concerning the infinitude of the atmoſphere of the earth and the planets, i. 57.

Hour, circle of, iii. 551.

Hurricanes, an account of thoſe in the Weſt Indies, iv. 540. The ſigns of their coming, *ib.* 53[illegible].

Hydraulics treat on the motion of fluids, iii. 466.

Hydrometer, of meaſuring the ſpecific gravity of fluids by it, iii. 430. A deſcription of, *ib.* 432. The requiſites for a good one, *ib.* 433.

Hydroſtatics, their nature, 369. The difference between theory and practice, *ib.* 370. Our ignorance relative to ſeveral particulars on this ſubject, *ib.* 371. Aeroſtation ſimilar to hydroſtatics, *ib.* 454.

Hydroſtatic ballance, it's uſe in determining the quantity of gold, &c. iii. 413. How it is conſtructed, *ib.* 416. It varies with the heat and cold of the weather, *ib.* 417. How to find the proportion of alloy mixed with gold, *ib.* 425.

Hygrometer, it's uſe: ſeveral ſubſtances affected by the moiſture or dryneſs of the air, iv, 502. An account of Mr. de Luc's hygrometer, *ib.* 503. The good effects of an hygrometer, *ib.* 504. The diſcoveries made by means of the hygrometer, *ib.* 512.

Hygroſcopic ſubſtances, different kinds, iv. 508.

Hypotheſes, obſervations on, i. 59. Conjectures diſcover no truths, *ib.* 60.; but confirm men in prejudice and ignorance, *ib.* 62.—See *Truth*.

I

Ice abſorbs all fire until it is wholly melted, i. 253. It requires an hundred and forty degrees of heat to convert it into water, *ib.* 274. Is a combination of water, when deprived of it's fire. ii. 33. Freezing is promoted by air and by agitation, *ib* 34. A bit of ice produces inſtant congelation in water cooled below the freezing point, *ib.* 35. It's great expanſive force, *ib.* 37, 38. The vaſt quantities of it in the northern ſeas, *ib.* 39. Ice is continually diminiſhing by the action of the air, *ib.* 41. The manner of rivers freezing, *ib.* 45. The great ſtrength of ice, *ib.* 45. Froſt does not penetrate deep into the earth, *ib.* 46. Ice may be produced by the evaporation of æther. *ib.* 46. The chemical properties of ice, *ib.* 56. —See *Fire*, *Water*.

Idols of the mind, Lord Bacon's account of them, ii. 102. Are of different kinds. *ib.* 103.

Ignition, an univerſal effect of fire, i. 326.—See *Fire*.

Impulſe the only material cauſe of motion, iv. 250.

Ingenhouz, Dr. firſt diſcovered the power which plants have of emitting vital air, i. 444. His experiments confirmed by others, *ib.* 446.—See *Light*, *Air*, *Vegetables*.

Inſects, the manner of their breathing illuſtrated in the larva of the muſca pendula, i. 160.

Inſtruments, philoſophical, deſcribed; general remarks on them, i. 265. Air-pump, *ib.* 105. An account of it's improvements, *ib.* 103. Philoſophical hammer, *ib.* 11. Cupping, *ib.* 18. Magdeburg hemiſpheres, *ib.* 19. Common pump, *ib.* 20. Transferrer of air, *ib.* Fountain of command, *ib.* 22. Anti-guggler, *ib.* 22. Common bellows, *ib.* 25. Guage to the air-pump, *ib.* 35. Bolt-head, *ib* 48. Smoke jack, *ib.* 72. Condenſing engine, *ib.* 84. Wind-gun, *ib.* 86. Artificial fountain, by condenſed air, *ib.* 87. Common pump, *ib.* 90. Forcing pump, *ib.* 93. Water-works at London bridge, *ib.* 94. Syphon, *ib.* 95. Tantalus's cup. *ib.* 96. Guages for the air pump, *ib.* 113. Pear-guage, *ib.* 117. Pyrometers, *ib.* 222. Calorimeter. *ib.* 253. Wedgewood's thermometer for aſcertaining intenſe degrees of heat, *ib.* 257. Another, invented by Mr. Jones, *ib.* 260. Papin's digeſter, *ib.* 290. Æolipile. or wind-ball, *ib.* 291. Argand's, or cylinder lamps, *ib.* 336. Pneumatic apparatus, *ib.* 427. Eudiometers, *ib.* 430. Dr. Nooth's machine to impregnate water with fixed air, *ib.* 481. M. Bettancourt's contrivance to meaſure the force of ſteam, ii. 73. Steam engine, *ib.* 74. Animated optical balls, *ib.* 253. The boundleſs

boundleſs gallery, the magical mirrors, *ib.* 256. The priſm, *ib.* 362. Teleſcopes, *ib.* 477. Spirit level, iii. 165. Plumb-line, *ib.* Odometer, *ib.* 169. Hydroſtatic paradox, *ib.* 387. Hydroſtatic bellows, *ib.* 389. Hydrometer, *ib.* 342. Diſcharging rods, iv. 340. Quadrant electrometer, *ib.* 341. Magic picture, ſpotted bottle, *ib.* 361. Thunder-houſe, *ib.* 382.

Jones, Rev. Mr. his obſervations on nature, i. 128. His juſt reflection on the origin of fire, 386. His remarks on the deſign of revelation, *ib.* 417. On the improvements in philoſophy, iv. 358. His remark on the electric matter and animal ſpirits, *ib.* 423. His obſervations on the ſuperiority of the northern hemiſphere over the ſouthern, in ſeveral particulars, *ib.* 567 to 570.

Iris.—See *Eye.*

Jupiter, his ſize, diſtance, revolutions, iv. 31. His four moons, *ib.* 32. His year, and motion round the ſun, *ib.* 169. His belts, *ib.* 233. Their changes, *ib.*

K

Kepler, his laws of aſtronomy, iv. 257 to 263.

Knight, Dr. his diſcoveries in magneliſm, iv. 449.

Knowledge, it's excellency, i. 26.

L

Language, natural and artificial; language was not invented by man, i. 156, 157.

Language, hieroglyphical, derived from the true knowledge of the natural world, i. 128.

Latent heat, doctrine of, explained, i. 269, 305, 395. Is of two kinds, of fluidity and elaſticity, *ib.* 354.—See *Phlogiſton, Fire, Heat.*

Lavoiſier, his opinion on fire, i. 211. His experiments with vital air, *ib.* 394. His miſtakes concerning elaſtic vapours, *ib.* 433 to 438. A confutation of his ſyſtem by Mr. Weiglib, *ib.* 505 to 516.

Laughter, how cauſed; good effects of moderate laughter, i. 157.

Lectures deſign of theſe. i. 123. To lead to God, to baniſh prejudice, to cultivate humility, and to promote knowledge, *ib.* 123 to 125.

Lens, may be formed of different ſubſtances, 389. Various effects produced by them, *ib.* 391.

Lenſes

Lenſes of various ſorts, plano-convex, plano-concave, double convex, double concave, concavo convex, ii. 184. Their different properties, *ib.* 186, 207, 208. Methods to find their focal lengths by experiments, *ib.* 213. The properties and phenomena of ſingle lenſes, *ib.* 218.

Levelling, the principle of it, iv. 53.

Lever, it's nature and properties, iii. 262. Levers are of three kinds, *ib.* 263 to 268. Of the hammer lever, *ib.* 266. Their various applications, *ib.* 270 to 276. It's properties applied to various ſubjects, *ib.* 307.

Leyden phial, iv. 339. How to charge it, *ib.* 340. The theory of it, *ib.* 343. On the diſcharge of this the two electricities ruſh into union from oppoſite directions, *ib.* 351. Different ſhocks by means of it, *ib.* 352. Confirmed by the electric ſpark, *ib.* 353. The two powers act in contrary directions, *ib.* 357. Various effects produced by it, *ib.* 359 to 361.—See *Electricity*.

Liberty, ſingular panegyric on, i. 368. The falſe pretenders to it, *ib.* 369. Genuine liberty, *ib.* 370.

Life, or the animating principle, iii. 61. The analogy between life and motion, *ib.* 246 to 255. Natural life depends on fire, iv. 402 to 410.

Light travels at the rate of 72,420 leagues in a ſecond, i. 175. Is the mediating ſubſtance between fire and air, *ib.* 194. Light combined with fire and water produces an aeriform fluid, *ib.* 439. Light extricates vital air from vegetables, *ib.* 443. Rays of light are extremely minute, ii. 139. It's operations and analogy, *ib.* 140. The advantages of it to man, *ib.* 141. The analogy between light and truth, *ib.* 144. Light, a property of fire, *ib.* 149. Light is a material real ſubſtance, is progreſſive, may be ſtopped and diverted, acts on all bodies, *ib.* 151. Light moves in a ſtrait line, *ib.* 154. Is ſucceſſive and cotemporary, *ib.* 155. The rays of it indefinitely ſmall, *ib.* 156. They carry the image of the point from which they proceed, *ib.* 157. Their reflexibility and refrangibility, *ib.* 158. In different mediums, *ib.* 159. The light of the moon is 300,000 times fainter than the light of the ſun, *ib.* 165. The quantity of light decreaſes as it recedes from the radiant, *ib.* 167. Light is ſuffocated by various bodies, *ib.* 168. A table of the quantity of light diſſipated in the atmoſphere, *ib.* 169. Rays of light are parallel, diverging or converging, *ib.* 171. Are reflected before they touch the body, *ib.* 224. Light contracts the pupil of the eye, *ib.* 315. Reflections on light, *ib.* 356. The rays of light are not homogenial, *ib.* 359. The rays of the ſun conſiſt of ſeven different coloured rays, *ib.* 360. The compound of all

the

the rays exhibits whiteneſs, *ib.* 361. The rays are of differentt refrangibility, *ib.* 365. Homogenial light ſuffers no alteration in any caſe, *ib.* 368. Rays which differ in their colour, differ alſo in their refrangibility, *ib.* 370. Bodies reflect rays of one colour, and tranſmit rays of another, *ib.* 401. The rays of light are thought to be put into a tranſient ſtate, and eaſily reflected and tranſmitted, *ib.* 401. This Sir I. Newton ſuppoſed was owing to the vibrations of a ſubtle fluid, *ib.* 402. The analogy between the reflection and refraction of the rays of light, *ib.* 404. Is imbibed by all bodies, except water and metals, *ib.* 435. Is matter moving in a ſtrait line from a body, *ib.* 444. Light and heat are different modifications of the ſame matter, *ib.* 445 to 462. Bodies are either luminous or illuminated, *ib.* 446. Without heat bodies will not emit light, *ib.* 447. The attractive gravitating matter in bodies has no power to reſiſt light, *ib.* 452. Light is acted upon by bodies at a ſmall diſtance by attraction and repulſion, *ib.* 454. The rays exhibit three fringes of coloured light round the ſhadows of ſmall bodies, *ib.* 456. The influence of light in the vegetable kingdom; it produces colours and ſmells, *ib.* 464. It's influence on animals, *ib.* 466. It's effects in chemiſtry, *ib.* 467. It's effects on colours and on wood, *ib.* 468, 469. The opinions of the ancients concerning light, *ib.* 470, 471. Queſtions concerning light, *ib.* 555. The opinions of the ancients concerning it, *ib.* 556. Of Plato, *ib.* 558. It's connection with fire, *ib.* And with electricity, iv. 385 to 387. It's energy and activity, *ib.* 404. Refraction of, *ib.* 137. Is different at different places, *ib.* 138. Effects reſulting from it, *ib.* 139. Aberration of, diſcovered by Dr. Bradley, *ib.* 147. On the light which appears in the eyes of ſome animals in the dark, whence it comes? *ib.* 424. The matter of light firſt formed, *ib.* 432.—See *Fire, Heat, Colours, Refraction, Reflection, Newton.*

Light of inflammation and light of ignition, their difference, i. 342.

Lightning, on the phenomenon of; varieties of it, iv. 367. It's peculiar property, *ib.* 368. It's effects are limited, *ib.* A remarkable inſtance of it, *ib.* 369. Produces whirlwinds, *ib.* The identity of lightning and electricity, *ib.* There is a reciprocal exchange from the earth to the cloud, *ib.* 370. The extent of their atmoſpheres, *ib.* 371. Cauſes concuſſions on the earth, *ib.* 374. Imparts magnetiſm, *ib.* 453.—See *Fire, Electricity, Magnetiſm.*

Luc, M. de admirable reflections on the true end of philoſophy, i. 281. His remarks on infidelity, *ib.* 285. His juſt

juſt obſervations on elaſtic fluids, *ib.* 439, 440. His obſervations on the change of ice into water, and *vice verſa*, ii. 56. On the ſtate of aqueous vapour in the atmoſphere, and laws of evaporation, *ib.* 75 to 89. His excellent philoſophical works; his refutation of materialiſm, iii. 66. His obſervations on hydrometers, *ib.* 434. An account of his whalebone hygrometer, iv. 503. Was in a ſtorm on the Buet, *ib.* 529. His remarks on barometers, *ib.* 559.—See *Hygrometer*.

Lunarium, deſcription of, iv. 189.

Lungs deſcribed, i. 150. Their ſituation and action, *ib.* 151. How much unknown, *ib.* Receive great quantities of blood, *ib.* 153. Their correſpondence with thought, *ib.* Their connection with the circulation of the blood, *ib.* 154. Expreſs various affections, *ib.* 155.

M

Magic lanthorn, it's conſtruction and uſe, ii. 206.

Magnetiſm was obſerved by the ancients; is unknown, iv. 435. Acts univerſally; natural magnet; it's contents, *ib.* 436. The artificial magnet is preferred, *ib.* 437. It's poles, *ib.* It's properties, *ib.* 438. It attracts iron, *ib.* 439. The ſphere of it's action is variable, *ib.* 440. The ſimilarity between magnetiſm and electricity, *ib.* 442 to 468. On the magnetic center, *ib.* 445. To render iron and ſteel magnetic, *ib.* 448. The moſt magnetiſm may be communicated to ſteel, *ib.* 452. Is communicated by lightning and percuſſion, *ib.* 453. On the magnetiſm of the air, *ib.* 455. Effects from it, *ib.* 457. The great uſes of it, *ib.* 458. An hypotheſis concerning it, *ib.* 469. Is probably ſupplied by the ſun, *ib.* 470.—See *Electricity*.

Magnets, the manner of arming them, iv. 454.

Man received an untaught language from nature, i. 156. Does not require the brighteſt evidence of truth at all times, *ib.* 200. Is at firſt led by his ſenſes, *ib.* 201. Is a compound being, *ib.* 242. Is an imperfect judge of heat and cold from his ſenſations, *ib.* 245. Is expoſed to errors from various cauſes, ii. 102. His knowledge is power, *ib.* 125. His limited views of Divine Providence, *ib.* 432. Collects his knowledge from experiments or obſervations, *ib.* 460. The variety of experiments he neceſſarily makes, *ib.* 461. His pride, *ib.* 462. Religion is adapted to his nature, *ib.* 473. His want of a Redeemer, *ib.* 474. Is indebted to *God* for the diſcoveries which he makes, *ib.* 478. His unity; he con-

tinues the ſame being, although he ſhould loſe different members, iii. 79. His organs only channels of conveyance, *ib.* 80. How much he is indebted to the mechanical powers, *ib.* 90. Men do not naturally ſwim, *ib.* 131. On walking in different directions, *ib.* 180. On jumping, ſkaiting, and running, *ib.* 181, 182. Man conſidered as an artificial machine, *ib.* 342. The vain theories for aſcertaining the ſtrength of man, *ib.* 343. The ſtrength of his frame, *ib.* 346. Is able to carry great weights, *ib.* 349. What depends on the poſture of man, *ib.* 350. Methods by which he draws weights, *ib.* 351. Inſtances of great ſtrength, *ib.* 352. His dependance; the advantages he derives from mechanics, *ib.* 367. A ſource of his errors, *ib.* 370. Of all animals, man is leaſt able to ſwim, *ib.* 409. His limited powers and comparative ignorance, *ib.* 511. His reaſon is to correct the fallacies of the ſenſes, iv. 53. Is apt to be forgetful of the bleſſings he enjoys, *ib.* 78, 79. The benefits he derives from the animals, *ib.* 207. General remarks on man, *ib.* 570. The means of his underſtanding the works of creation, *ib.* 571.—See *God, Providence, Mind.*

Mariners' compaſs, a deſcription of it, iv. 458. When diſcovered, and by whom, *ib.* 459. It's variations, *ib.* When this variation was diſcovered, *ib.* 462. — See *Magneliſm.*

Mars, his ſize, diſtance, diameter, revolutions, iv. 29, 30, 93. His year and motion round the ſun, *ib.* 169. His atmoſphere and poles, *ib.* 232.

Materialiſm, danger from the ſyſtem of, ii. 266. Conſidered as a ſyſtem, iii. 65. It's danger and miſery, *ib.* 66. Particularly examined and confuted, *ib.* 66 to 79. Particularly by the unity of the percipient being, *ib.* 79. Perceptivity cannot be annexed to a ſyſtem of matter, *ib.* 81.

Matter can never form an intelligent being, ii. 262. The uſe made of it by the ancient atheiſts, *ib.* 263; and ſome modern philoſophers, *ib.* 265. Is the object of the five ſenſes, iii. 2. An inquiry concerning matter, *ib.* 3. The common properties aſcribed to it, *ib.* 4. The properties allowed to matter are, impenetrability, extenſion, diviſibility, and hardneſs, *ib.* 5 to 7. Matter is not infinitely diviſible, *ib.* 10. Illuſtrated, *ib.* 11. The great diviſibility of matter, *ib.* 12. Sir I. Newton's opinion of matter, *ib.* 14. Matter hath a capacity for motion, *ib.* 16. Concerning the inertia of matter, how underſtood, *ib.* 17. The abſurdities reſulting from this, *ib.* 18. Matter can only move as it is moved, *ib.* 19. Is gravity

gravity an eſſential property of matter, *ib.* 20. Matter and mind totally diſtinct, *ib.* 50. In what this difference conſiſts, *ib.* 52. The opinions of the ancients concerning matter; it's viſibility is ſuppoſed to ariſe from it's form, *ib.* 54. The firſt matter homogeneous, *ib.* 55. This original matter was repreſented by Saturn and Ops, *ib.* 56. The primary forms of matter are extenſion, figure, organization, *ib.* 57, 58. Matter is impreſt with the marks of mind, *ib.* 60. Some have repreſented matter as without impenetrability and inertia, *ib.* 68.—See *Mind*.

Mayow, Dr. his diſcoveries of airs in the laſt century, i. 426.

Meaſures, philoſophical, remarks on them, i. 266.

Mechanics, their antiquity, iii. 89. The wonderful machines of the ancients, *ib.* 90. The object of mechanics is motion, *ib.* 95.

Mechanical powers, on, iii. 257. Their uſe to man, *ib.* Poſtulata for the conſideration of mechanical powers, *ib.* 259. The alluſion of the Platoniſts and Pythagoreans to theſe, *ib.* 312. The advantages gained by them, *ib.* 324. Of power and time, *ib.* 326. Of the difference between practice and theory, *ib.* 332. Cauſed by the weight and friction, *ib.* 333. Their uſe to manufactures and merchants, *ib.* 364.

Mercury congeals at 40° below 0. ii. 52, 53. Mercury congealed by a frigorific mixture, *ib.* 54. A long column of it is ſupported in a glaſs tube, iii. 35.

Mercury, his ſize, diſtance, annual revolution, iv. 19 to 21.

Meridian, iii. 523. The degrees on it, *ib.* 549.

Metals, a table of the different expanſions of different metals, i. 231. The analogy between them and tranſparent media, ii. 425.

Meteorological diaries, importance of them, iv. 476.

Meteors, their appearance of great heights in the atmoſphere; difficulty of accounting for them, i. 55.

Microſcopes, their ſeveral kinds, ii. 538. The advantages to be derived from them, *ib.* 539. Of their optical effects, *ib.* 541. Of the ſingle microſcope, *ib.* 546. It's properties, *ib.* 548. Of the compound microſcope, *ib.* 549. It's properties, *ib.* 550. Of the ſolar microſcope, *ib.* 551. General obſervations on them, *ib.* 552. Their imperfections, *ib.* 554.

Milky way, iii. 566. The computation of the number of ſuns in it, by Dr. Herſchel, iv. 219.

Mind and matter totally diſtinct, iii. 50. Mind always has ſome end in view, *ib.* 52. The powers and qualities of mind, *ib.* 53. Mind, it's ſtrong deſire after truth, *ib.* 60. Forms exiſt in mind before they are exhibited in matter,

ib. 61. Every thing excellent is an emanation from mind, *ib.* 62. The mind of man is not a compound, *ib.* 81. It's immortality, *ib.* 85.

Mirrors, plane, ii. 229. Their nature and properties, *ib.* 230. Observations on them, *ib.* 256. How to judge of their goodness, *ib.* 257. Of convex mirrors, *ib.* 233. Of concave mirrors, *ib.* 234. Deceptions and experiments by these. *ib.* 238. Increase heat, and kindle fire, *ib.* 242. Of pictures seen in them; to find the focal length of a spherical mirror, *ib.* 244. General properties of mirrors, *ib.* 245.

Moisture is invisible water, iv. 509. Totally absent; extreme, *ib.* 510.

Monsoons, or periodical winds, iv. 534. An account of them, *ib.* 535 to 537. How caused, *ib.*

Montgolfiers, M. discovered the air balloon, iii. 444. Their experiments, *ib.* 445.

Moon, phenomena of; her periodical motion, iii. 533. Her various uses, iv. 25. Her diameter, distance, revolution, appearances, *ib.* 26, 27. Her orbit, *ib.* 103. Her nodes; her conjunction with the sun, *ib.* 104. The periodic month, and synodical, *ib.* 105. Her different phases, *ib.* 108. Eclipses of, when caused, *ib.* 114. The nodes of the moon, *ib.* 115. Is eclipsed by the shadow of the atmosphere of the earth, *ib.* 116. Sometimes the moon totally disappears, *ib.* Her appearance in an eclipse, *ib.* 118. The beginning or end discovers the longitude, *ib.* 119. On what the quantity and the duration of the eclipse depends, *ib.* 120. She moves 2077 miles in an hour, *ib.* 127. Is about 240,000 miles from the earth, *ib.* The moon only intersects the plane of the ecliptic in two points, *ib.* 128. General phenomena of the moon, *ib.* 191. Her different phases explained, *ib.* 192. Has always the same face to the earth, *ib.* 193. Is always half enlightened by the sun, *ib.* 194. Her days and nights equal 14½ of our days, *ib.* May be in conjunction or opposition without an eclipse; the cause of this explained, *ib.* 196. Her appearance when viewed through a telescope; consists of mountains and cavities, *ib.* 230. Volcanoes have been seen on her surface, *ib.* 231. Her atmosphere, *ib.* 232. She gravitates towards the earth, *ib.* 263. Is acted on with the greatest force when nearest the earth, *ib.* 267. Her orbit equal to 60 times the earth's semi-diameter, *ib* 271. Her irregularities, *ib.* 285. Whence caused, *ib.* 286 to 291.

Motion, improperly considered as the cause of fire, i. 206 to 209. On the communication of motion by collision, iii. 227. Is supposed to cause elasticity, *ib.* 231. The laws

laws of the communication of motion, *ib.* 233. In elaſtic and non-elaſtic bodies, *ib.* 235. The inexhauſtible ſource of motion and impulſe, *ib.* 240. The cauſe of motion, *ib.* 245. Impulſe is the material cauſe of motion, iv. 249.

Motion, apparent, obſervation on it, ii. 348. In what degree it muſt be to become viſible, *ib.* 348. Is change of place, iii. 96. Involves the idea of ſpace and time, *ib.* Velocity is the quantity of motion, *ib.* 98. The ſources of motions, *ib.* 100. Of ſimple motion, *ib.* 102. Circumſtances obſerved in this, *ib.* Of the quantity of motion, *ib.* 107. To compute the momentum, *ib.* 108. The laws of motion, *ib.* 111 to 113. Objection to the firſt law of motion, *ib.* 112. Motion is not a property of matter, *ib.* 19. Of compound motion, *ib.* 116. It's general laws, *ib.* 117. Inſtances of compound motion, *ib.* 126. Of accelerated motion, *ib.* 132. An inquiry whether motion be a cauſe or an effect, *ib.* 208, 209. On the permanent motions in nature, *ib.* 246. Fire and light are the inſtruments of motion in nature, *ib.* 254. The permanency of motions, *ib.* 250. There is no motion independent of the action of any medium, *ib.* 254. Motion, whence produced; varieties of motion, iv. 431.

Munro, Dr. his objections to the nervous and electric fluid being the ſame anſwered, iv. 422, 423.

Muſical ſounds, effects of, i. 186. Organs in man to produce theſe, *ib.* 190.

N

Nadir, iii. 520.

Nature, the views of it infinite, ii. 129. Is inexhauſtible on every ſide, *ib.* 130. Is a mere name, when conſidered as independent of God, *ib.* 260. Is the benevolence of the Almighty providing for all the inhabitants of the earth, *ib.* 460. Appears more excellent the more it is examined, iii. 1. The operations in nature are carried on mechanically, *ib.* 16. There is nothing inſulated in nature, iii. 244. A general circulation through all nature, *ib.* 251. The immenſity of the works of nature, iv. 47. The perfection of them, *ib.* 168. Nature has no will of it's own; is a combination of cauſes and effects, *ib.* 211. All the works of nature are connected, *ib.* 297. Remarks on the chemiſtry of nature, *ib.* 475.—See *God, Providence, Man, Sun, Air, Water.*

Nebulæ of fixed ſtars, iv. 224. Planetary nebulæ, *ib.* 225.

Needle, magnetic, it's diurnal variation, iv. 464. Is affected by the aurora borealis, *ib.* It's dip; by whom discovered, *ib.* 465. The variations in the dip, *ib.* 466. The needle is affected by the aurora borealis, *ib.* 467.—See *Magnetism, Mariner's Compass.*

Newton, Sir Isaac, his first rule of philosophising, i. 61. His discoveries of the aerial pulses; the manner in which they are propagated, *ib.* 169. His works; his rules of philosophising, ii. 133, 134. His grand discoveries concerning light and colours, *ib.* 359. His optics, *ib.* 369. His *experimentum crucis*, ib. 371. An eulogium on him, *ib.* 384. He supposed that bodies of different densities reflected different rays of light, *ib.* 393. His conjectures on the fits of easy reflection and transmission of a ray of light, *ib.* 401, 402. He discovered that inflammable bodies possessed the refractive power more than bodies not inflammable, *ib.* 426. Constructed a reflecting telescope, *ib.* 527. His great modesty, *ib.* 529. His opinion concerning the original atoms, iii. 14. His discoveries of gravitation, *ib.* 44, 45. Not very consistent in hydrostatics, *ib.* 372. His theories on the subject, *ib.* 505. An account of his principles, *ib.* 506. His observation on the curvilineal motion of the moon, iv. 266. His mathematical astronomy, *ib.* 257.—See *Light, Colours, Gravitation.*

Nodes of the moon, iv. 128. Go backwards nineteen degrees and an half in every year, *ib.* 131.

Nonius, scale to estimate the divisions on it, iv. 486.

O

Observer of nature, character of, i. 126, 127, 129.

Opacity arises from the discontinuity of the particles of bodies, and the different density of the intervening medium, ii. 406. How destroyed, *ib.* 407. Different significations, *ib.* 448. Of opacity, considered as a positive quality in bodies, *ib.* 449. It does not depend on the solid matter in bodies, *ib.* 451.—See *Light.*

Optics, the excellency of the knowledge of them, ii. 149.

Oxygenation, or acidifying, is produced by the combination of any substance with vital air, i. 455.

P

Parallax, annual, diurnal, horizontal, iv. 139 to 143. The accuracy necessary in finding it. *ib.* 145.

Pascal, M. his character: he first applied the barometer to measure mountains, i. 33.

Pendulum, it's vibration explained, isochronous, i. 169. The analogy between a pendulum and a musical string, *ib.* 173. Account of pendulums, iii. 196. Their oscillations, *ib.* 198. Their isochronism, *ib.* 201. Pendulums are simple and compound, *ib.* 203. Of the center of oscillation in compound pendulums, *ib.* 204. Of the time of their oscillation, *ib.* 210. Are affected by heat and cold, *ib.* 211; by their place on the globe, *ib.* 212. Huygens adapted them to clocks, *ib.* 215. Wooden pendulums, their properties, *ib.* 216. The gridiron pendulum, it's construction and advantage, *ib.* 218, 219.

Penumbra of an eclipse, iv. 317.

Percussion, center of, iii. 211.

Perspiration, great quantities of food carried off by it, i. 134.

Philosopher, the universality of knowledge which ought to form his character, ii. 93. A picture of a true philosopher, *ib.* 99. His character, as drawn by Lord Bacon, *ib.* 119. Studies the intention of nature, *ib.* 121. He proceeds by induction, *ib.* 122; and thus forms general axioms, *ib.* 123. He makes use of every help, particularly of analogy, *ib.* 128. He proceeds with great caution, *ib.* 132. The error of the modern philosophers, ii. 458. The weakness of vanity in a philosopher, *ib.* 476.—See *Truth*.

Philosophy, natural, excellence and advantage of it, i. 3. 64. Origin of the name, *ib.* 4. It's tendency to elevate the mind, *ib.* 98; and promote religion, *ib.* 99. Leads to the great Author of all things, *ib.* 123. The business of it, *ib.* 127. It's tendency to cultivate sublime taste, *ib.* 195. It's grand object, *ib.* 200. True philosophy is not friendly to infidelity, *ib.* 420 to 422. Is concerned with final causes, *ib.* 362. Is continually presenting scenes of beauty to the mind of man, *ib.* 240. Is a source of wisdom never to be exhausted, *ib.* 241, 527. Looks to the grand end of Divine Providence, *ib.* 528. It advances the cause of religion, ii. 2. The method of reasoning in it, *ib.* 98. Leads us to the knowledge of God, *ib.* 120. It's connection with religion, *ib.* 432. The discoveries of philosophy gradual, iv. 298.—See *Air*, *Astronomy*, *Colours*, *Elastic Fluids*, *Electricity*, *Fire*, *Gravity*, *Light*, *Magnetism*, *Matter*, *Mechanics*, *Meteorology*, *Microscopes*, *Phosphorus*, *Telescopes*, *Water*.

Philosophy, inductive, an account of, ii. 126.

Philosophy, false, it's errors and dangers, i. 125.

Phlogiſton, or the principle of inflammability, i. 342. Denied by the French philoſophers, *ib.* 343. Is a ſubſtance *ſui generis*; the matter of light and heat, *ib.* 344. Proved by the decompoſition of water, and the luminous appearance then exhibited, *ib.* 245 to 352. It is the ſolid ſubſtance detained in the phlogiſtic compoſition, *ib.* 353. Is reſtored by animal and vegetable ſubſtances *ib.* 354; particularly by the influence of light for the phlogiſtication of vegetable bodies, *ib.* 356; and by the maſs of colour which they obtain, *ib.* 357. Is imparted from vegetables to animals, *ib.* 361. Is maintained by Mr. Weiglib, in oppoſition to the French chemiſts, *ib.* 505 to 516. It's exiſtence proved, *ib.* 506; particularly by the re-production of the metallic calces, *ib.* 508. Other conſiderations in ſupport of it, *ib.* 518. It's univerſality and energy, *ib.* 519. The analogy between phlogiſton, or fixed fire or fixed air, *ib.* 519 to 522.—See *Fire*, *Heat*.

Phoſphorus, the ſeveral kinds of, ii. 428. The Bolognian phoſphorus was diſcovered by Vincenzo Caſcariolo; it's properties, *ib.* 434. Artificial phoſphorus, how formed, *ib.* Phoſphori generally diffuſed, *ib.* 437. Of Canton's phoſphorus, how prepared, *ib.* 438. Imbibes it's property from light, *ib.* 439. Mr. Wilſon's phoſphorus exhibited vivid colours, *ib.* Phoſphorus is an incipient ignition in certain bodies, *ib.* 440. Different kinds of phoſphori, 441. They do not emit the identical light which they have received, *ib.* 442. The agreement and diſagreement of phoſphoretic and phlogiſtic bodies, *ib.* 443. The change it undergoes when burnt in vital air, i. 452.—See *Fire*.

Phyſicians, the error into which ſome of them have fallen, ii. 261.

Plane, *inclined*, deſcent of bodies upon it, iii. 154. Has a relative and abſolute gravity, *ib.* 155 to 162. It's uſe, *ib.* 294.

Planets, on, iii. 541. They are ſpherical opake bodies, iv. 15. Inferior and ſuperior planets, *ib.* 19, 20. A table of their diameters and diſtances, *ib.* 39. Revolutions round the ſun, *ib.* 40; and their own axes, *ib.* 41. Their proportional magnitude, *ib.* 41. Their heliocentric and geocentric latitude, *ib.* 81. Their conjunction and oppoſition, *ib.* 82. Appearances of the inferior planets, *ib.* 90; and of the ſuperior, *ib.* 94. Their direct, ſtationary, and retrograde motion, *ib.* 95. Their ſatellites, *ib.* 97. Inferior planets, their ſuperior and inferior conjunctions, *ib.* 173. Their apparent irregularities explained, *ib.* 175. Of the ſuperior planets, as ſeen from the earth, *ib.* 176; are moſt probably inhabited worlds, *ib.* 242. They gravitate towards

wards the ſun, *ib.* 273. The irregularity produced among them by gravitation, *ib.* 280.
Planetarium, it's antiquity and uſe, iv. 165. Proves the truth of the Copernican ſyſtem, *ib.* 177. How to rectify it for the true places of the planets, *ib.* 179. To uſe it as a telurian, *ib.* 180. To explain the changes of the ſeaſons, *ib.* 181. The parallel, direct, and right ſpheres, *ib.* 185.
Plants are ſenſibly affected by light, ii. 465. Plants expoſed to light emit vital air, *ib.* 466. Are affected by vital air, *ib.* 468.—See *Air, Light, Vegetables.*
Plato's idea of the intertexture of air and fire in the human frame, i. 198. His obſervation on colours, ii, 383. On the preſent ſtate of human knowledge, iii. 57.
Plenum, a, neceſſary for motion by impulſe, iv. 249. Bodies are able to move in a plenum, *ib.* 253.
Plurality of worlds, reaſons for them, iv. 240.
Pneumatics.—See *Air.*
Points, cardinal, and points of the compaſs, iii. 520.
Pole ſtar, iii. 517. It's poſition, *ib.* 518. How to be found, *ib.* 519. It deſcribes a ſmall circle round the pole, *ib.* 582.
Poles, or arctic and antarctic circles, iii. 556.
Poles of the magnet, iv. 441. Their action on each other, *ib.* 441. Their action on ſteel filings, *ib.* 443. The poles ſhould always be left connected, *ib.* 454.
Prayer, a, for wiſdom and virtue, ii. 136 to 138.
Prejudice, it's miſchiefs and effects, i. 27.
Prieſtley, Dr. his diſcoveries of airs, i. 425. His ſyſtem of materialiſm fully examined and confuted, iii. 65 to 79.
Projectiles, motion of, iii. 185. Galileo's diſcoveries in them, *ib.* 186. Are oppoſed by the air's elaſticity, *ib.* 194. The great quantity of motion which they loſe, *ib.* 195.
Providence diſcoverable in the ſmalleſt as well as greateſt events; no ſuch thing as chance, ii. 429.
Providence. Reflections on the WISDOM and GOODNESS of Providence, in the ſuction of animals and the ſwallowing of food, i. 25. In the preſſure of the air, i. 38. In the univerſal good deſigned in all his works, *ib.* 64. In the admirable proviſion made for breathing, *ib.* 149. In the bleſſing of ſpeech, *ib.* 155. In the ſinging of birds, *ib.* 163. In the admirable conſtruction of the human ear, *ib.* 192. In the creation of the univerſe, and particularly of the air, for the moſt univerſal good, *ib.* 196. In the proviſion made for the warmth of different animals, *ib.* 218. In guarding againſt the too ſudden changes of heat or cold, *ib.* 278. In the continued agency of the Divine Mind, *ib.* 284. In the inſenſible operations of the riſe of vapours, *ib.* 319. In the proviſions made for ſupply-

ing heat and light, *ib.* 361. In rendering every part of matter active and useful, *ib.* 362. In the great and benevolent ends which are obtained in nature by simple means, *ib.* 366. In the agency and operations of fire, *ib.* 414. In the abundant production of vital air, and in the preservation of the equilibrium of the atmosphere, *ib.* 449. In the uses resulting from the vegetable kingdom, *ib.* 450. In the provision made against cold, *ib.* 460. In the ocean, and it's inhabitants, *ib.* 94. In the various benefits bestowed by means of water, *ib.* 95. In the construction, form, and uses of the eye; and in the blessings of sight, *ib.* 273, 275, 276, 356, 357. In restoring the purity of the air by means of vegetables, *ib.* 467. In the simplicity and energy of his works, iii. 51. In the divine agency exhibited in nature, *ib.* 61. In the powers and excellency of the soul of man, *ib.* 86. In the regular order and establishment of the Divine Mechanic, *ib.* 91; both in the natural and moral world, *ib.* 92, 93. In the starry heavens, *ib.* 577. In the gradual progress of arts and sciences, iv. 4. In the immensity of his works, and their continual preservation, *ib.* 47, 48. In the various changes of the seasons, *ib.* 78. In the clear discoveries of divine intelligence and design, and in the supplies of the numerous wants of man, *ib.* 203, 205. In the wonderful structure of the human frame, *ib.* 206. In the vegetable kingdom, *ib.* 206, 209. In the animal kingdom, *ib.* 207, 210. In acting for an uniform purpose, through a great variety of different means, *ib.* 208. In the universal distribution and management of fire, *ib.* 410. In the degree of heat which every country enjoys in the course of the year, *ib.* 552. In the arrangement of mountains and seas, *ib.* 553. In the perfection of the word and work of God, *ib.* 571.—See *God, Man, Natural Philosophy.*

Pulley, it's properties, iii. 289. Are fixed and moveable, *ib.* 290. Of the moveable pulley, *ib.* 290 to 294. Of Smeaton's pullies, *ib.* 316. Of their immense force, *ib.* 318.

Pulses of the air, propagated by sound, i. 269. Are alternately condensed and rarified, *ib.* 171. All pulses move at an equal rate, 1142 feet in a second, *ib.* 173.

Pump, common, invented by Ctesebes, i. 90. Raises water thirty-four feet, *ib.* 91.——*Forcing*, acts by condensed air, *ib.* 93.

Pumps, of. Of the chain-pump, iii. 483. It's construction and use, *ib.* Of the common pump, *ib.* 484. It's construction and action, *ib.* 485. The piston must be less than thirty-three feet from the water, *ib.* 486. Of the forcing pump, it's construction and use, *ib.* 489. Of De la

la Hire's pump, *ib.* 491. Of Taylor's pump, *ib.* 492. Of the Heſſian pump, *ib.* 493. Of Vera's pump, *ib.* 494.—See *Air, Water.*

Pupil of the eye, an account of, ii. 314. It's motions; is naturally dilated, *ib.* 315. Is contracted by light, *ib.* 316.—See *Eye, Light.*

Pyrometer, an inſtrument for meaſuring the degree of heat, i. 222.

Q

Quadrant, aſtronomical, it's uſe and deſcription, iii. 525 to 527. To find the altitude of any celeſtial body, *ib.* 530.

Quadrant of altitude, iii. 552.

R

Rain is ſuppoſed to proceed from the decompoſition of the air, reſulting from the aqueous vapours being converted into an aeriform fluid, ii. 79. Heavy ſhowers cauſed by clouds of different electricities being driven together, iv. 372. How much we are ignorant of it; on what it depends, *ib.* 512. Rain is not the precipitation of water ſimply evaporated in the air, *ib.* 513. Is indicated by a hollow noiſe, *ib.* 533. Rains in the Weſt Indies, *ib.* 540. Moſt rain falls in woody and mountainous countries, *ib.* 547. Rain and ſnow generally give vitreous electricity, *ib.* 555. Generally follows ſudden changes of the weather, *ib.* 561.—See *Vapour.*

Rainbow, the ignorance of the ancients concerning it; explained by Sir Iſaac Newton, ii. 336. The order of colours; the varieties of them, *ib.* 387. Illuſtrated: the ſecond bow explained, *ib.* 389. On what the ſize of the bow depends, *ib.* 392.—See *Light, Colours, Refraction.*

Rain-guage, it's conſtruction and uſe, iv. 501.

Read, Mr. his experiments on electricity, iv. 355, 356.

Reamur, M. his diſcoveries on eggs, i. 132.

Reflection of light, ii. 224. All reflection reciprocal, *ib.* 226. Laws of reflection, *ib.* 228. No colours are diſplayed by reflected light, *ib.* 416.—See *Light.*

Refraction of light, laws of, ii. 161 to 164. Refraction at a plane ſurface, *ib.* 176. At a concave ſurface, *ib.* 180.—See *Light.*

Religion and true philoſophy mutually aſſiſt and illuſtrate each other, i. 99. Religion our greateſt good, *ib.* 100. It's excellency and advantages, *ib.* 103 It requires a ſo-

briety of mind, i. 286. It implies a dependence on the Deity, ii. 96. Religion and philoſophy agree together, iv. 430. The arts and ſciences flouriſh moſt where religion is cultivated, *ib.* 569.—See *God*, *Providence*, *Man*.

Reſinous electricity.—See *Electricity*.

Reſpiration receives vital air, and mixes it with the blood in the lungs, i. 459. Reſpiration is ſimilar to combuſtion; reſpiration explained, i. 141, 150, 151. Concerned in ſmelling, laughing, ſpeaking, weeping, *ib.* 159.

Rods, conducting, iv. 377. Are the means of reſtoring the equilibrium, *ib.* 378. Obſervations againſt pointed conductors, *ib.* 380. They only draw off the electric matter when immerſed in it's atmoſphere, *ib.* 381. Cannot attract the lightning out of it's direction, *ib.* Objections againſt them, *ib.* 382.—See *Electricity*.

S

Salts produce great degrees of cold, ii. 51. How they form ſaline liquids. *ib.* 66.

Saturn, his ſize, diſtance, revolution, iv. 33. His ring and moons, *ib.* 35. 234. His year, and motion round the ſun, *ib.* 169. His belts, *ib.* 235.

Screw, male and female, iii. 209. Of the endleſs ſcrew, *ib.* 301. *ib.* Of the micrometer ſcrew, *ib.* 304.

Sea. Saltneſs of the ſea, inquiries into the cauſe of, ii. 20. Dr. Halley's weak opinion, *ib.* 27. It was originally ſalt, *ib.* 28. The water is moſt ſalt where the ſun is vertical; an eaſy method to aſcertain the ſaltneſs, *ib.* 29. The advantages derived from the ſea, to temperate the air, iv. 551.

Seaſons of the year accounted for, iv. 68. Summer is longer than winter, *ib.* 75.

Senſes lead to all phyſical knowledge, i. 200. The imperfections attending their information, *ib.* 201. This to be judged of from experiment, *ib* 202.

Sight. Of imperfect ſight, ii. 318. Of old, or long-ſighted eyes, *ib.* 319. Of ſhort-ſighted eyes, *ib.* 332. How aſſiſted, *ib.* 334.—See *Eye*.

Smeaton, Mr. an account of his pyrometer, i. 222 to 230.

Smoke.—See *Chimnies*.

Smith, Dr. his obſervation on the diviſion of labour illuſtrated, iii. 365.

Snow keeps the ground warm in winter, i. 216, 218. The form of it's flakes, ii. 43.

Solution, an effect of fire, i. 376. Deſcription of it's operation, *ib.* 377. Illuſtrated in the ſolution of ſalts, *ib.* 379.

Sound,

Sound, benefits reſulting from it, i. 163. Cauſe of, *ib.* 164, 183. Of muſical ſounds, *ib.* 185. Of ſympathetic ſounds, *ib.* 188. Sounds of metals, how improved, *ib.* 164. Claſſes of ſonorous bodies, *ib.* 165. Sound is beſt conducted in a denſe medium. *ib.* 166. May be conveyed through wood or water, *ib.* 166. It does not proceed from a flux of air, but from a vibratory motion of the particles of air in their proper place, *ib.* Sound vibrates according to the motion of a cycloidal pendulum, *ib.* 172. Differences among ſounds, *ib.* 173. The intenſity is inverſely as the ſquares of the diſtance, *ib.* The velocity of ſound continues always the ſame, *ib.* 174. Sound diminiſhes from want of perfect elaſticity in the air, *ib.* Is more perfect in ſome winds than in others, *ib.* 175. It's effects on ſolid bodies, iv. 405.—See *Air*.

Sound judgment, the means to form it, i. 27.

Space, the idea of it from extenſion, iii. 9. Space, abſolute and relative, *ib.* 96. The analogy between time and ſpace, *ib.* 97.

Speaking trumpet explained, i. 176.

Spectacles, their uſe, ii. 232. Directions in the choice of them, *ib.* 324. Directions to diſcover if they be wanted, *ib.* 329.

Speech, the bleſſing of it; the various parts which form it, i. 155.

Spheres, right, parallel, or oblique, iii. 556.

Spirit of man. the opinions which the ancients entertained of it, iii. 64. The goſpel does not treat of it's natural immortality, *ib.* 67. Dr. Hartley repreſented the ſoul as unformly paſſive, *ib.* 68. The excellencies of the ſoul, *ib.* 86.

Springs of water. different opinions concerning them, ii. 17, 18. Are not ſupplied by rains and dews, *ib.* 19. Some run the ſame in a wet or dry ſeaſon, *ib.* 21. Springs are principally ſupplied from the ſubterraneous ſtores of water, *ib.* 25.

Stars, the numbers diſcovered by Herſchel, ii. 478. Their apparent diurnal motion, iii. 516. Of the fixed ſtars, their twinkling, *ib.* 561. Are arranged in conſtellations, *ib.* 562. Are divided into different claſſes, from their ſize, *ib.* 563. The catalogues of them, *ib.* 564; by Hipparchus, by Bayer, *ib.* 565; by Flamſteed, by De la Caille, by Woolaſton, *ib.* 566. The immenſe number of the ſtars, *ib.* 567. The numbers diſcovered by Dr. Herſchel, *ib.* 568. How to obtain a knowledge of the conſtellations, *ib.* 569. The vaſt diſtance of the fixed ſtars from us, of the firſt magnitude, iv. 44; of the ſecond, *ib.* Their parallax, *ib.* 136. Their apparent motions, from the

the aberration of light, *ib.* 145. Their motion, *ib.* 148. Different ſtars appear at different times of the year, *ib.* 171. Their diſtance great beyond computation, *ib.* 212. Have a general motion, *ib.* 213. The variety in theſe; ſome appearing, others vaniſhing, *ib.* New ſtars; catalogues formed, *ib.* 214. Remarkable new ſtars, *ib.* 215. Stars, their proper motion, *ib.* 216. Stars of different luſtre, ſuppoſed to be at different diſtances from us, *ib.* 221. Nebulæ of ſtars, *ib.* 222. A perforated nebula, *ib.* 225. All the univerſes of ſtars or ſuns connected together, *ib.* 226. Are probably ſuns; their uſe, *ib.* 240. There are more ſtars in the northern than in the ſouthern hemiſphere, *ib.* 568.

Steam of boiling water occupies 1800 times more ſpace than water, i. 299. It's nature and properties, ii. 83.

Steel-yard, an account of, iii. 284.

Suction, improperly applied to account for ſome phenomena of air, i. 12.

Sun. The emanation of matter from the ſun one of the prime movers of the machine of the world, i. 359. It's influence under different forms, *ib.* 360. The ſolar fluid is abſorbed in vegetables, and is the cauſe of colour, flavour, &c. *ib.* 443. The ſolar ſubſtance in one place is *fire*, in another *light*, in a third *electricity*, ii. 447. The ſun animates and quickens the globe of the earth, as the ſeminal bed of his rays, *ib.* 462. The ſource of natural life, *ib.* 463. His influence on the earth, *ib.* particularly in the vegetable kingdom, *ib.* 465. His riſing and ſetting, iii. 522. His annual motion, *ib.* 535. He riſes and ſets in different parts, *ib.* 536. He moves about a degree every day, *ib.* 537. The center of the ſyſtem; the heart of heaven, iv. 16. His influence, ſize, diſtance, motion, *ib.* 17. His ſuppoſed atmoſphere, *ib.* 19. Is the center of the ſyſtem, *ib.* 62. His apparent motion, *ib.* 63. The motion of the ſun appears differently to inhabitants of different planets, *ib.* 65. He appears to move in the ecliptic, *ib.* 66. His apparent diameter greater in winter than in ſummer, *ib.* 76. Eclipſes of the ſun, how cauſed, *ib.* 121. are viſible to only a few inhabitants of the earth, *ib.* 122. Total eclipſe remarkable, *ib.* 123. Are total, annular, or partial, *ib.* 124. On what the quantity and duration of the eclipſe depends, *ib.* 125. His parallax, 135. His tropical and ſiderial year, *ib.* 149. A meaſurer of time, *ib.* 151. The inequality of his apparent motion, *ib.* 161. Appears to paſs through the ſigns of the zodiac in a year, *ib.* 170. Dr. Herſchel conjectures that our ſun belongs to the milky way, *ib.* 218. The ſpots on his ſurface, their variety,

riety, *ib.* 227. Peculiarities of their nucleus and umbra, *ib.* 228. Sometimes they appear to burſt, *ib.* 229. Their directions different, *ib.* Conjectures concerning them, *ib.* His center of gravity, *ib.* 278. Is the ſource of the electric fluid, *ib.* 393. Is the cauſe of natural life, *ib.* 403. Probably ſupplies the magnetic fluid, *ib.* 470. Is a principal ſource of heat, *ib.* 544. His rays act as fire, and increaſe the expanſive force of fire, *ib.* 545. Cauſes an undulating motion in the atmoſphere, *ib.* 558. Shines more on the northern than the ſouthern hemiſphere, *ib.* 567.—See *Light, Heat, Colours, Electricity, Magneliſm.*

Swimming, on, iii. 404.

Syphon explained, i. 94. Forms Tantalus's cup, *ib.* 96. Accounts for intermitting ſprings, *ib.* Fuller account of; principles on which they act, iii. 499. Diſtiller's ſyphon, *ib.* 500. Of s'Graveſand's ſyphon, *ib.* 501.

T

Teleſcopes, obſervations on their uſe, ii. 477. Lord Bacon's remark on them, *ib.* 478. Are ſuppoſed to have been diſcovered by Roger Bacon, *ib.* 479; and by Janſen, *ib.* 482. Were improved by Galileo, *ib.* 482. Of refracting teleſcopes, *ib.* 483. Their properties, *ib.* 488 to 492. Their apparent field, *ib.* 490. Of the aſtronomical teleſcope, it's properties, *ib.* 493 to 497. Imperfections ariſing from the diſperſion of the rays of light in them, *ib.* 502. Of the compound object glaſs, *ib.* 504. From the refrangibility of the light, *ib.* 508. How corrected, *ib.* 509. Of teleſcopes with ſeveral eye-glaſſes, *ib.* 513. Of achromatic teleſcopes, *ib.* 517. Were invented by Mr. Dollond, *ib.* 520. Are compoſed of different kinds of glaſſes, *ib.* 523. This diſcovery was claimed for Euler, *ib.* 525. Of the reflecting teleſcope, *ib.* 526. By whom diſcovered, *ib.* 527. Of the Gregorian teleſcope; it's properties, *ib.* 529. Of the Newtonian teleſcope, *ib.* 534.

Temperature of the earth, obſervations on it, iv. 549. On what it depends, *ib.* 551.

Thermometers, the principle on which they are conſtructed, i. 246, 247. Of Fahrenheit, Reaumur, and Celſius, the relation between them, *ib.* 248. Mercurial thermometer, an accurate meaſure of heat, *ib.* 249. Experiments on it, *ib.* 309. May be reduced by ether, ii. 50. It's conſtruction and uſe, iv. 492, 493. The requiſites for a good one, *ib.* 495, 496. The manner of filling it, *ib.* 497. How to graduate it, *ib.* 498. To ſeal it hermetically,

cally, *ib.* 499. The thermometer is a ſcale of expanſion, indicating the transfuſion of the igneous fluid, *ib.* 501.—See *Fire, Heat.*

Thunder, remarks on, iv. 530.

Time, of, iii. 96. The analogy between time and ſpace, *ib.* 97. The meaſure of it, *ib.* 214. Obſervations on time, *ib.* 221. Mr. Locke's opinion of it, *ib.* 222. Dr. Clarke's miſtake concerning ſucceſſive and unſucceſſive duration, *ib.* 224. Quotation from Tucker, *ib.* 225. Time true and apparent, and mean, iv. 157. Equation of time, *ib.* 158. Whence the difference ariſes, *ib.* 159. Reflection on the lapſe of time, *ib.* 163.

Tin, it's peculiar quality in rendering other metals more ſonorous, i. 164.

Torricellius, his invention of the barometer, i. 29.

Tranſparency, the leaſt part of all bodies are tranſparent, ii. 405. Tranſparency depends on homogeneity, *ib.* 406. Tranſparent bodies reflect rays of one colour, and tranſmit rays of another, *ib.* 407. Tranſparency acquired, *ib.* 427. The advantages from the tranſparency of glaſs, *ib.* —See *Light, Opacity.*

Tropics, iii. 555.

Truth, love of, i. 28. In what manner it ſhould be ſought for, *ib.* It's gradual advances, *ib.* 36. Nature of, *ib.* 62. The cauſe of, injured by a deference to the authority of names, i. 210. It's analogy or correſpondence with water, ii. 7. It's peculiar analogy with light and the ſun, *ib.* 147. It's nature, *ib.* 265.

Tſchirnhauſen, M. effects produced by his burning-glaſs, ii. 195.

V

Vacuum, no perfect vacuum of air can be produced by the air-pump, i. 112. A vacuum in nature diſproved, iii. 252 to 254.

Vapours, not permanently elaſtic fluids, i. 431. Are deſtroyed by preſſure and cold, *ib.* 432. The accidents occaſioned by their ſudden expanſion, i. 291. Occupy 14,000 times more ſpace, as vapours, than as water, ii. 74.

Vapours, veſicular and concrete, an account of, ii. 86. In the form of ſpherical balls, ii. 87. Only the 3600 part of an inch in ſize, *ib.* 87. The difference between vapours and elaſtic fluids, iv. 504. Watery vapours are one half leſs than a like volume of air, *ib.* 505. Vapours conſiſt of fire and water united, *ib.* 507. How they are decompoſed, part with their water to hygroſcopic ſubſtances,

ſtances, *ib.* 508. The condenſation of them a ſource of heat, *ib.* 546.—See *Fire, Air, Water.*

Vegetables, when acted upon by the ſolar light, afford abundance of vital air, i. 444; but in the ſhade, the air they yield is impure, *ib.* 446. They imbibe mephitic and emit vital air, *ib.* 449. Admirable reflections on their uſes, *ib.* 450. They conſume more water than falls in rain, ii. 21. Their influence on the climate and weather, iv. 551.—See *Light, Air, Water.*

Velocity, relative and abſolute, iii. 104. Of the velocity of falling bodies; practice differs from theory, 141.

Venus, in ancient mythology, repreſented the principle of matter which was united to, and acted upon by fire, i. 416.

Venus, her ſize, diſtance, diurnal and annual revolutions, different appearances, atmoſphere, iv. 21 to 24. Her conjunctions with the ſun, *ib.* 84. When ſhe appears ſtationary, *ib.* 88. Her phaſes, *ib.* 92.

Vince, Mr. his obſervations on friction, iii. 334 to 340. His obſervations on wheel-carriages on a plain ground, *ib.* 358.

Viſion is cauſed by the refraction of the rays of light, ii. 289. Why are not objects ſeen in an inverted poſition? *ib.* 294 to 297. Viſion is not produced on the optic nerve, *ib.* 298. Of the extent and limits of viſion, *ib.* 299. Is limited by various means, *ib.* 300. Viſion is confuſed by the undulating motion of the air, *ib.* 301. The angle of the leaſt viſion, *ib.* 302. Of diſtinct and clear viſion, *ib.* 304. On what it depends, *ib.* 305. At what diſtance it is perceptible, *ib.* 309. The appearance of diſtance affected by light and colours, *ib.* 340. Miſtakes concerning diſtances, *ib.* 344. Fallacies of viſion explained, *ib.* 350. Of viſion by images, *ib.* 351 to 354.—See *Light, Eye.*

Vitreous electricity.—See *Electricity.*

Voice of man, wonders and variety of it, i. 191.

Voltaire, his abuſe of philoſophy, i. 99.

Vulcan, in ancient mythology, repreſented the principle of fire, i. 416.

W

Walker, Mr. of Oxford, his experiments for freezing mercury, ii. 54.

Water is converted into vapour whenever the preſſure of the atmoſphere is diminiſhed to a certain degree, i. 118. Gradually parts with it's latent fire whilſt it is freezing, *ib.* 275. May be cooled ſeveral degrees below the freez-

ing point, *ib.* Receives a leſs quantity of heat than what quickſilver does, *ib.* 283. Water boils with a ſmall degree of heat when the preſſure is removed, and *vice verſa*, *ib.* 297. Water is not diſſolved by air, *ib.* 301. 1600 gallons of water raiſed from an acre of ground in a hot ſummer's day, *ib.* 319. Water conſtitutes the ponderable part of all aeriform fluids, *ib.* 439. ii. 59. It's nature and properties, *ib.* 2. It's various uſes, *ib.* 3. Is not a compound of vital and inflammable airs, *ib.* 4, 5. Of water in a fluid ſtate, *ib.* 6. Is compreſſible in a ſmall degree, *ib.* Enters into the compoſition of all bodies, *ib.* 7. It's analogy to truth, *ib.* The quantity of it ſuſpended in the atmoſphere, *ib.* 8. It increaſes the weight of certain bodies expoſed to it, *ib.* 9. Has a ſimilar effect on the human frame, *ib.* 10. Water in mixture or combination with bodies, *ib.* 12. Is a general cement, *ib.* 13. Is never obtained pure, *ib.* 14 to 16. Is of different degrees of ſoftneſs, *ib.* 15. Is purified by diſtillation, *ib.* 16. The water from rain is not a ſufficient ſupply for ſprings, *ib.* 19. The ſubterraneous ſtores of water, *ib.* 23. Theſe ſupply ſprings and vegetables, *ib.* 25. Sea water depoſits it's ſalt by freezing, *ib.* 29. According to the quantity of heat is the quantity of ſalt which water can diſſolve, *ib.* 31. Water becomes ice by loſing it's fire, *ib.* 33. Boiled water does not ſo eaſily freeze as unboiled, *ib.* 34. Water may be cooled below the point of congelation without freezing, *ib.* 35, 36. It increaſes in bulk juſt as it freezes, *ib.* 37. Ice is changed into water by means of fire, *ib.* 57. Is the ponderable part of all aeriform fluids, *ib.* 59. It's ſimple particles are of a certain form, *ib.* 64. By means of acids the particles of water are brought nearer together without loſing the fire of liquifaction, *ib.* 65. Is probably the principal conſtituent in oils and ſalts, *ib.* 67. Is the univerſal menſtruum, *ib.* 68. Water combines with all other ſubſtances, *ib.* 69. Water expanded in vapour is 800 times rarer than air, *ib.* 70; and 14,000 rarer than itſelf, *ib.* 74. Is a principal ingredient in vegetable and animal ſubſtances, *ib.* 90. The varieties of the weather depend on the changes of water, iv. 478. Can receive a greater degree of heat before it boils, than when it boils, *ib.* 495. Is not held in ſolution by air, *ib.* 506. In what manner it is received by different hygroſcopic ſubſtances, *ib.* 508.—See *Fire*, *Air*, *Vapour*, *Evaporation*.

Waters, mineral, their nature and properties, ii. 89. Their different qualities, *ib.* 92. Are artificially made, *ib.* 93.

Weather,

Weather, knowledge of, very intereſting, iv. 471. But at preſent is uncertain, *ib.* 474 to 559. The phenomena which are to be obſerved, *ib.* Depend on the circulation of matter, *ib.* 477. Inquiries concerning it; inſtruments to be uſed, *ib.* 478. A barometer, *ib.* 479. How to attain a more perfect knowledge of the weather, *ib.* 557, 558. Signs of the weather from the barometer, *ib.* 561, 562. From the thermometer and hygrometer, *ib.* 563. From the appearance and different currents of clouds, *ib.*

Wedge, it's uſe, iii. 296 to 299.

Wheels, of their work, iii. 320. How to compute their forces, *ib.* 323.

Wheel and *axis*, it's properties, iii. 285. Acts as a perpetual lever, *ib.* 287. Crane-wheel, capſtan, *ib.* 288. Watch-ſpring, *ib.* 289. Of the fly-wheels, *ib.* 327.

Wheel-carriages, on, iii. 352. Their utility, *ib.* 356. On the center of gravity in wheel-carriages, *ib.* 357. Obſervations on them on plain ground, *ib.* 358. On hard ground, with obſtacles, *ib.* 359. On ſand, *ib.* 362. The advantages of ſprings, *ib.* The reaſon of this, *ib.* 363.

Wieglib, *Mr.* a German chemiſt, an abſtract of his Diſſertation on Phlogiſton, i. 505. Supported by the experiments of Mr. Green, *ib.* 516.

Wilſon, *Mr.* his experiments on phoſphoric bodies in a dark chamber, ii. 436.

Winds, cauſe of, i. 69. Bacon's ſuggeſtion for a hiſtory of them, iv. 530. His queries concerning them, *ib.* 531. Different cauſes which affect them, *ib.* Are influenced by the return of air to a ſtate of vapour, *ib.* 532. On the origin of winds, *ib.* 533. Their irregularities, *ib.* 534. Are affected by the diurnal rotation of the earth, *ib.* 536. Various tempeſts produced by winds, *ib.* 539. Are affected by the ſoil over which they blow, *ib.* 541. Remarkable unhealthy winds, *ib.* 542. Their indication of a change of weather, *ib.* 564.—See *Air*.

Wood, is pervious to air, i. 133. Effects of this, *ib.* 134.

Woods, their utility in a country reſpecting rain, iv. 547.

World, the great powers of it, heat and gravitation mutually counterballance each other, i. 364. The influence of theſe, *ib.* 365. The northern hemiſphere of the world ſuperior to the ſouthern, iv. 567.

Z

Zenith, iii. 529.

Zodiac, iii. 554.

DIRECTIONS TO THE BINDER.

The Fifth Volume contains the Index and the Plates. The Index is to be placed firſt, and the Plates to ſucceed it, in the following Order:

1	Air, &c.	Six Plates	i to vi.
2	Optics	Eight Plates	i to viii.
3	Mechanics	Five Plates	i to v.
4	Hydroſtatics, &c.	Three Plates	i to iii.
5	Aſtronomy	Fifteen Plates	i to xv.
6	Electricity, &c.	Two Plates	i to ii.

In all Thirty-nine Plates.

SUBSCRIBERS OMITTED.

Leonard Smelt, Eſq. *Langton.*
Dr. Powel, *Brecon.*
Mr. Scott, *Suffolk-Street.*
